

Computer Networks

Computer Networks(Marks 7 to 9)

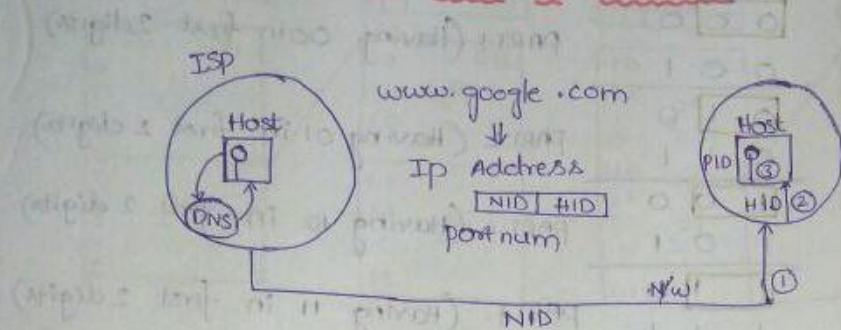

- Concept of Layering
 - OSI/TCP Layer
- Physical Layer
 - Encoding, Transmission media(Guided and Unguided) and Modes, Network types & Topologies
- Data link Layer
 - Logical Link(LLC) sublayer
 - Flow control methods(Stop & Wait, Sliding Window:(Go back N, Selective Repeat))
→ Use arrows to eliminate silly mistake in CRC and start after o(Gate 2017 mistake)
 - Error Control Methods(Parity Check, CRC, Checksum, Hamming Code)
 - Medium Access control(MAC) sublayer
 - Framing (Fixed and Variable length), Bit Stuffing
 - LAN protocols
 - Token Ring
 - Aloha(^{Used at University of Hawaii}Pure/Slotted Aloha)
 - CSMA/CD & Exponential Back-off Algorithm
→ Use 1/(1+6.44a) formula for CSMA/CD OR Ethernet Not 1/(1+2a) to find efficiency
 - Ethernet[IEEE 802.3]
 - Networking Devices (Bridges, Switches, Routers etc.) + Collision/Broadcast domain
- Network Layer
 - IPv4 Addressing → Write Decimal and binary number together to avoid confusion like 224 = 1110 0000
 - IPv4 header
 - Fragmentation → Read MTU properly and check if data segment is divisible by 8 for the OFFSET to work properly
 - IP support protocols (ARP, RARP, BOOTP, DHCP, ICMP)
 - Routing & its protocols
 - Non-Adaptive(Static): Flooding
 - Adaptive: Distance Vector Routing & Link State Routing
 - Switching: (Types -Circuit, Packet(types:Datagram, Virtual Circuit) and Message Switching)
- Transport Layer
 - TCP Header
 - TCP Flow Control
 - TCP Congestion control
 - TCP Timer Management
 - Quality of Service (Traffic Shaping) → In Token Bucket, I do calculation mistake like $5/3 = 2.66$ | $8/5 = 2.66$
 - UDP Header
- Application Layers protocols
 - DNS, E-mail, SMTP, FTP, HTTP

Top Notorious Topics (Recent/Frequent)

COMPUTER NETWORKS

INTRODUCTION TO CN AND IP ADDRESS

⇒ The service that is used to convert the Domain name to IP Address is called **Domain Name Service**.

⇒ port number is used to identify a particular process in the host, for well known services the port num are already predefined and fixed

$$\text{http} \rightarrow \text{port num} = 80$$

$$\text{SMTP port num} = 25$$

$$\text{FTP} \rightarrow \text{port num} = 21$$

⇒ Even though your intention is to reach google.com you are visiting DNS first and then getting the IP Address of google.com and then visiting the google home page. This is actually a overhead which is also called "DNS overhead". So this problem of overhead can be rectified by, when you get the IP Address of google.com you store it actually on your computer for some time, and if you again want to visit google you can directly get IP Address from your computer. If your IP Address in computer expires, there is no another alternative, you have to go to DNS.

Binary = 0,1

$$2^2 = 4$$

Binary = 0,1

Octal = 0,1,2,...7

$$2^{10} = 1024 = K$$

Decimal = 0,1,2,...9

$$M = 2^{20}$$

Hexa decimal = 0,1,2,...9

$$G = 2^{30}$$

A,B,...F
10,11,12

$$T = 2^{40}$$

$K = 2^{10}$
$M = 2^{20}$
$G = 2^{30}$
$T = 2^{40}$

Now, the possible binary numbers with 1 Bit, 2 Bits, 3 Bits are

<u>1 Bit</u>	<u>2 Bits</u>	<u>3 Bits</u>
0	0 0	0 0 0
1	0 1	0 0 1
	1 0	0 1 0
	1 1	0 1 1
		1 0 0
		1 0 1
		1 1 0
		1 1 1

PART 1 (Having 00 in first 2 digits)

PART 2 (Having 01 in first 2 digits)

PART 3 (Having 10 in first 2 digits)

PART 4 (Having 11 in first 2 digits)

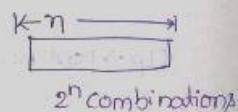

⇒ No. of possible sets formed by 1 bit = 2

⇒ If i choose 1 bit I am going to divide the number space into 2 parts = 2

⇒ If i choose 2 bits I am going to get 4 parts = 2^2

⇒ If i choose K bits the number space / Address space will be divided into

2^K parts

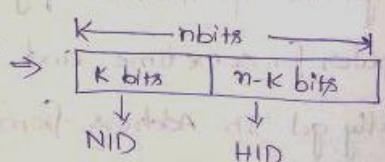

⇒ So, if i have 'n' bits the no. of possible ways are 2^n 

Now, if i choose 'K' bits the entire space will be divided into 2^K parts

⇒ 2^K parts = 2^n numbers

⇒ 1 part = $2^n / 2^K$ numbers

⇒ 1 part = 2^{n-K} numbers

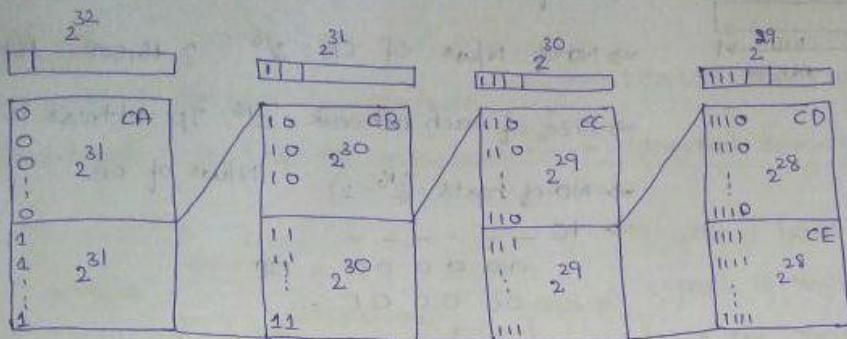

⇒ Size of Each NID = 2^{n-K}

⇒ In operating system 'n' bits = Address, K = page offset / Blk no / Segment no

⇒ In computer organization 'K' = TAG, (n-K) = Block SIZE.

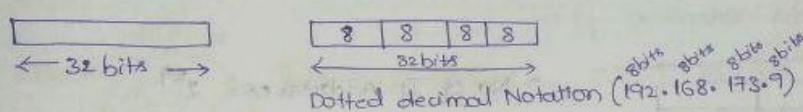

⇒ IP Address size = 32 bits in CN. $\Rightarrow 2^{32}$ IP Address are possible

CLASS FULL IP ADDRESS CLASSIFICATION

The no. of IP Addresses possible in a Netw of class A = 2^{29} class C = 2^{29}
 class B = 2^{30} class D = 2^{28}

Now, the popular Representation of IP Address = Binary Notation, Dotted decimal Notation(4 octets)

CA = starts with '0'

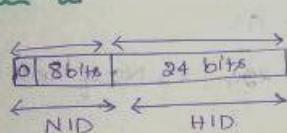

CD = starts with 1110

CB = starts with 10

CE = starts with 1111

CC = starts with 110

CLASS A

⇒ The No. of possible Netw of class A = $2^7 = 128$

⇒ size of each Network = $2^{24} = 16M$ (NASA/PENTAGON)

USES CA]

⇒ No. of hosts = $(2^{24} - 2)$

⇒ But practically 126 Netw are possible in CA

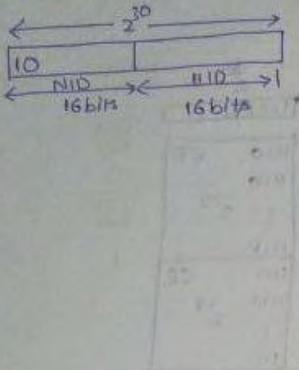

$$\begin{array}{r} 0 \dots \\ \text{bit 0} \text{ of } \text{CIDR} \dots \\ 00000000 = 0 \\ 00000001 = 1 \\ \vdots \\ 11111111 = 127 \end{array}$$

⇒ we dont use the starting Address (All 0s) and last Address (all ones)

⇒ ∴ No. of Netw in CA = $128 - 2 = 126$ practically.

RANGE = 0-126

CLASS B

\Rightarrow No. of IP Addresses = 2^{30}

\Rightarrow No. of N/w^s of CB = $2^4 \approx 16,000 = 16K$ N/w^s

\Rightarrow Size of each network = 2^{16} IP Address in one N/w^s of CB

\Rightarrow No. of hosts = $(2^{16} - 2)$

$\Rightarrow 10 \dots \dots \dots$

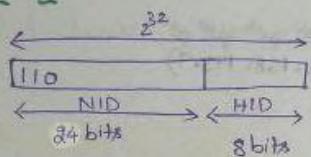

$00\ 00\ 00\ 00 = 128$

$00\ 00\ 01 \dots$

$11\ 11\ 11\ 11 = 191$

\Rightarrow RANGE = 128-191

CLASS C

\Rightarrow No. of IP Addresses = 2^{29}

\Rightarrow No. of N/w^s of CC = 2^8 N/w^s = 2 million

\Rightarrow Size of Each N/w = 2^8 IP Address are in one N/w^s of CC

$\Rightarrow 110 \dots \dots \dots$

$00\ 00\ 00 = 192$

$00\ 00\ 01 = 193$

$11\ 11\ 11\ 11 = 223 \Rightarrow$ No. of hosts = $(2^8 - 2)$

\Rightarrow RANGE = 192-229

CLASS D

There is nothing called as N/w ID and HID in CD and CE

CD

1110 $\dots \dots$
00 00 = 224

11 11 = 239

RANGE = 224-239

↓
1) Used for Multicasting

2) Group Emailing, Group Broadcasting

CE

1111 $\dots \dots$
00 00 =

11 11 = 255

RANGE = 240-255

↓
1) Used for Military Applications

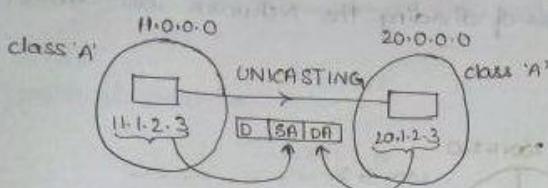

2. TYPES OF CASTING - UNICAST, LIMITED BROADCAST, DIRECTED BROADCAST

CASTING

1. Unicast - one host to one host
2. Broadcast - one host to many hosts

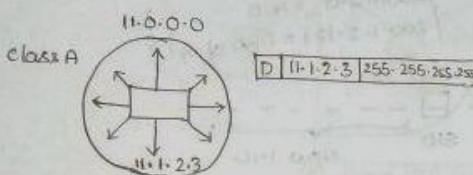

Limited Broadcasting

Directed Broadcasting

⇒ when I have All 0s in the HID part it represents NID that is the reason we don't use 1st IP Address as the valid IP Address to any host

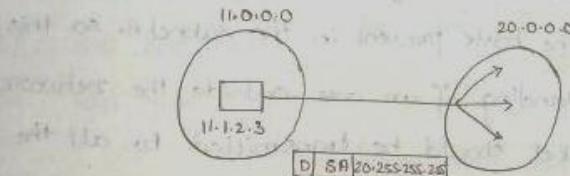

LIMITED BROADCASTING

⇒ If Destination Address = DA =

255.255.255.255 then the packet will be sent to all the hosts in the NID. LBA = 255.255.255.255

DIRECTED BROADCASTING

⇒ we are not going to use the IP address containing all 1's in HID part, it is used for DIRECTED BROADCASTING (DBA).

DBA: NID, HID= all 1's

IP Address

NID

DBA

LBA

What is the purpose of a subnet mask in an IP address and mask combination?

To indicate the default gateway IP address.

To define the physical location of the address.

To save on the possible addresses that you can use in the network.

To delineate the network portion of the address from the host portion.

None of the above

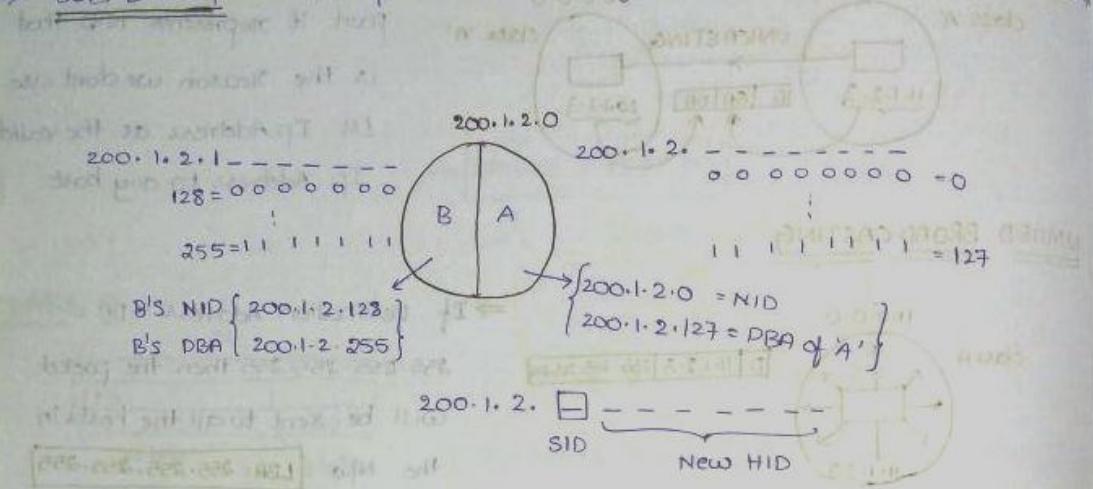

Yes mask separate the host bits with the network bits.

3 SUBNETS, SUBNET MASK, ROUTING

→ when the size of the NID is Big then the maintenance will be difficult.

→ Lack of security when the size of NID is Big, so we divide the Network into small parts and this process is called Subnetting.

→ "SUBNETTING" is the process of dividing the Network into Smaller Networks.

Now, ambiguity arises in the above subnetting, if it is say 200.1.2.0 it means the whole network or only the first subnet and if it is say 200.1.2.255 then there is a dilemma whether to transfer the packet to all the hosts in the Network or only to the hosts present in the subnet A. So this depends upon where we are standing if we are outside the network then we assume that the packet should be transmitted to all the hosts in the network, if I am standing inside the packet will be transmitted to the hosts in subnet A.

Q11 Consider a router that interconnects three subnets:

Subnet 1, Subnet 2 and Subnet 3. Suppose all of the interfaces in each of these three subnets are required to have the prefix 223.1.17/24. Also, suppose that Subnet 1 is required to support at least 60 interfaces, Subnet 2 is to support at least 90 interfaces, and Subnet 3 is to support at least 12 interfaces. Provide three network addresses (of the form A.B.C.D/X) that satisfy these constraints.

Time taken to answer this question 00:00:11 sec

Marked Right Wrong View Solution

Subnet 1 = 223.1.17.0/27, Subnet 2 = 223.1.17.128/25 Subnet 3 = 223.1.17.192/28

Subnet 1 = 223.1.17.0/26, Subnet 2 = 223.1.17.64/26, Subnet 3 = 223.1.17.128/28

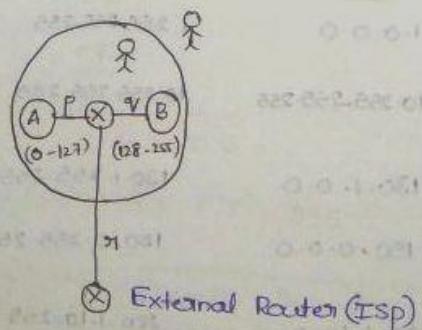

Subnet 1 = 223.1.17.0/25, Subnet 2 = 223.1.17.128/25, Subnet 3 = 223.1.17.192/28

Your answer is Wrong

Correct Option

Took my time & also silly mistake

subnet 3

Q11 What is the broadcast address of subnet number 32 in the classful addressing scheme, given an ip address 12.3.0.6/12?

Time taken to answer this question 00:00:13 sec

Marked Right Wrong View Solution

12.32.0.255

12.23.255.255

12.47.255.255

None of the above

None D

As this IP belongs to class A so network mask is 255.255.0.0

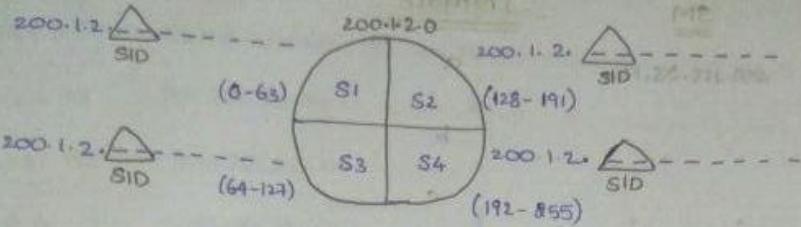

The subnet bits = 4 Total number of subnets possible = $(2^4)-2=14$

So there is no possibility of number 32 subnet because the total number of subnets possible is 14.

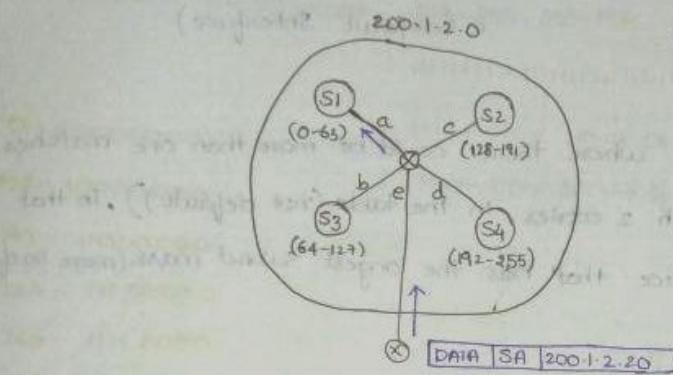

My Mistake
I failed to create subnet

* There will be loss of IP addresses due to "SUBNETTING"

FOUR SUBNETS

The practical view is.

→ Here the challenge is you should identify the NID or Subnet for which a particular IP Address belongs to.
Here this can be done using "SUBNET MASK"

SUBNET MASK

SM: 32-bit Number

1's: SID, NID part

0's: HID part

ASSIGNEE LENGTH SUBNET MASKING

Now, the subnet mask for the above NID will

be $\frac{\text{NID}}{200.1.2.0} \rightarrow \text{SID}$

$$\boxed{\text{SM} = 255.255.255.192}$$

→ Given an IP Address, if you bitwise AND with SM you will get NID for which the IP belongs to

$\boxed{\text{SM } \& \text{ IP} = \text{NID for which the given IP Belongs}}$

$$\text{IP: } 11001000.00000001.00000010.10000020 = 200.1.2.130$$

$$\text{SM: } 11111111.11111111.11111111.11000000 = 255.255.255.192$$

$$\text{NID: } 11001000.00000001.00000010.10000000$$

$$\boxed{200.1.2.128}$$

Q.3) An organization have the network address as 129.50.0.0. The organization wants to maximize the hosts and also wants 8 subnets for the organization. To get the maximum hosts & 8 subnets what will be the subnet mask number.

Time taken to answer this question 00:02:26 hrs

Hide Answer Old Notes New Notes Show Comments

255.255.192.0

255.255.224.0

255.255.240.0

Solution: Ans C
Sol: It's a class B address, network mask is 255.255.0.0
For 8 subnets = $2^3 - 2 = 6$ subnets - 3 bits are not sufficient
 $+ 2^4 - 2 = 14$ subnets - 4 bits are sufficient
So mask no will be 255.255.11110000.00000000 = 255.255.240.0

255.255.248.0

Knowing, did mistake to check for subnet number

Consider a diagram network using 8-bit host addresses. Suppose a router uses longest prefix matching with the following forwarding table.

Pref. match	Interface
00000000	0
01000000	1
10000000	2
11000000	3

The total number of addresses that can pass through all interfaces?

Solution: Ans: 256

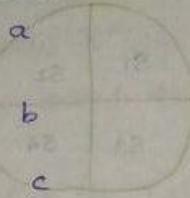

Explanation: Every interface contain starting two bit different for pattern matching. The one interface has 2⁸ = 256 addresses. So total number of address for one interface is 2⁸. For four bit there are two possibility of 0 and 1. So total number of address for one interface is 2⁴ = 16. We have 4 given interfaces. So the total number of addresses pass through is = 16 x 256 = 256.

Your Answer is wrong (64)

ROUTING TABLE

<u>NID</u>	<u>SM</u>
200.1.2.0	255.255.255.192
200.1.2.64	
200.1.2.28	
200.1.2.192	
0.0.0.0	0.0.0.0

Interface

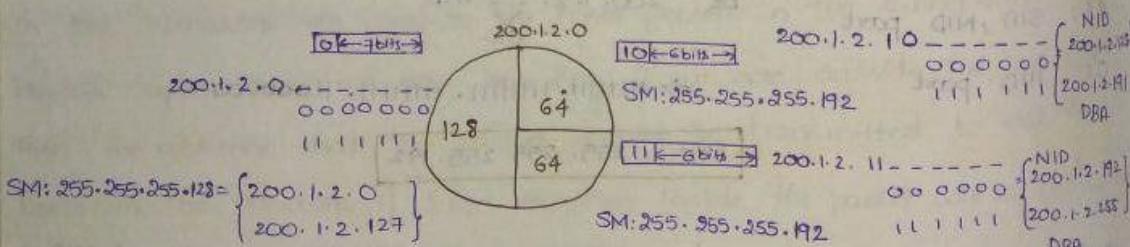

d

e (default Interface)

→ There may be some cases where there could be more than one matches (over packet matches with 2 entries in the table (not default)). In that case choose the interface that has the longest Subnet mask (more right).

4. VARIABLE LENGTH SUBNET MASKING

Step 1: Divide the entire NID into 2 parts choosing 1 bit

Step 2: Divide the subnet (your choice) into 2 parts by choosing another bit then you will get 3 subnets

⇒ The NID that are having same sizes have the same "Subnet mask".

⇒ when the NID size is Big then the SM will be small.

when the NID size is small then the SM will be Big.

ROUTING TABLE

<u>NID</u>	<u>SM</u>	<u>INTERFACE</u>
200.1.2.0	255.255.255.128	a
200.1.2.128	255.255.255.192	b
200.1.2.192	255.255.255.192	c
0.0.0.0	0.0.0.0	d

Now, Given Subnet mask : 255.255.255.192

$$= (11111111.11111111.11111111.00000000) = (2618, 6\text{cls})$$

$$\therefore \text{NID} + \text{SID} = \text{No. of cls}$$

0 - 00000000

128 - 10000000

$\therefore \text{NID} + \text{SID} = 26 \rightarrow \text{If class A is subnetted, then,}$

192 - 11000000

$$8 + \text{SID} = 26 \Rightarrow \boxed{\text{SID} = 18}$$

$$\therefore \text{No. of Subnets} = 2^{18}$$

224 - 111.00000

240 - 1111.0000

$$\rightarrow \text{if CB, NID} + \text{SID} = 26$$

248 - 11111.000

$$\boxed{\text{SID} = 26 - 16 = 10} = 2^{10} \text{ Subnets}$$

252 - 111111.00

$$\rightarrow \text{if CC, NID} + \text{SID} = 26$$

254 - 1111111.0

$$\boxed{\text{SID} = 26 - 24 = 2} = 2^2 \text{ subnets}$$

255 - 11111111.0

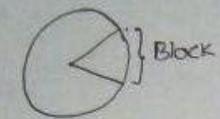

5. SUBNET MASKING QUESTION

<u>SUBNET MASK</u>	<u>No. of Hosts</u>	<u>SUBNETS IN CA</u>	<u>CB</u>	<u>CC</u>
CA 255.0.0.0	$2^{24} - 2$	2^{24}	-	-

255.192.0.0	$2^{22} - 2$	2^2	-	-
255.240.0.0	$2^{20} - 2$	2^4	2^{20}	2^{20}
255.255.0.0	$2^{16} - 2$	2^8	2^{16}	2^{16}
255.255.254.0	$2^{12} - 2$	2^5	2^{12}	2^5
255.255.255.0	$2^8 - 2$	2^6	2^8	1
255.255.255.24	$2^5 - 2$	2^4	2^5	2^3
255.255.255.240	$2^1 - 2$	2^0	2^{12}	2^4

CLASSLESS INTER DOMAIN ROUTING (L-6)

IANA = Internet Assigned Number Authority

→ Generally the IP Addresses in CIDR Notation

BID HID

is represented as a.b.c.d/n

→ n = NID bits → if n=20, NID = 20 bits

HID = 12 bits

→ n = Slash Number

32 bits

FORMATION OF CIDR BLOCKS

These are the Rules for forming CIDR Blocks

- 1) All the IP Addresses should be contiguous
- 2) The Block size should be a power of 2
- 3) The Starting Address should be divisible by evenly the size of the Block.

$(n-k)$ bits | k bits
n-bit → Binary Number

$[n/2^k]$ ⇒ last k bits = Remainder
last $(n-k)$ bits = Quotient

100.1.2.32
100.1.2.33
100.1.2.34
100.1.2.35
100.1.2.36
100.1.2.37

Whether these IP Addresses form a CIDR Block?

Rule 1 ✓

Rule 2: No. of IP Addresses = 16 = 2^4 ✓ ⇒ HID = 4, BID = 28

Rule 3: $100.1.2.00100000 \div 2^4 = \text{LSB (4 bits)}$ {Least significant bits} = 0000 ✓

∴ They form CIDR Block

2) 20.10.30.32
20.10.30.33
20.10.30.34
20.10.30.35
20.10.30.36
20.10.30.37

Rule 1 = ✓

Rule 2: $(63-32)+1 = 32 = 2^5$ ✓ (In powers of 2) HID = 5 bits
NID = 27 bits

Rule 3: $20.10.30.00100000 \div 2^5 = \text{last 5 bits}$
= 00000 ✓

∴ They form CIDR Block

3>

$150 \cdot 10 \cdot 20 \cdot 64$

$150 \cdot 10 \cdot 20 \cdot 65$

$150 \cdot 10 \cdot 20 \cdot 66$

!

$150 \cdot 10 \cdot 20 \cdot 127$

Rule 1 ✓

Rule 2: $(127 - 64) + 1 = 64 = 2^6 \Rightarrow \text{HID} = 6, \text{BID} = 26 \text{ Bits}$

Rule 3: $150 \cdot 10 \cdot 20 \cdot 01000000 \div 2^6 = 000000 \checkmark$

FORM
CIDR
BLOCK ✓

4>

$20 \cdot 10 \cdot 30 \cdot 35 / 27$ Derive the Range of CIDR Block?

$\Rightarrow \text{BID} = 27 \text{ bits}$

$\text{HID} = 5 \text{ bits}$

BID HID
 $20 \cdot 10 \cdot 30 \cdot 001 \underline{00011}$

$0000 = 32$

$0001 = 33$

!

$1111 = 63$

$01010000 \underline{00000000}$

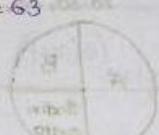

00000000

$\Rightarrow \text{Block} = 20 \cdot 10 \cdot 30 \cdot 32$

$20 \cdot 10 \cdot 30 \cdot 33$

$20 \cdot 10 \cdot 30 \cdot 63$

5>

$100 \cdot 1 \cdot 2 \cdot 35 / 28$

$\text{BID} = 27 \text{ bits}$

$\text{HID} = 5 \text{ bits}$

BIK NO=BIKID

$100 \cdot 1 \cdot 2 \cdot 0010 \underline{0011}$

$100 \cdot 1 \cdot 2 \cdot 32$

$100 \cdot 1 \cdot 2 \cdot 33$

!

$100 \cdot 1 \cdot 2 \cdot 47$

6> $100 \cdot 1 \cdot 2 \cdot 35 / 20$

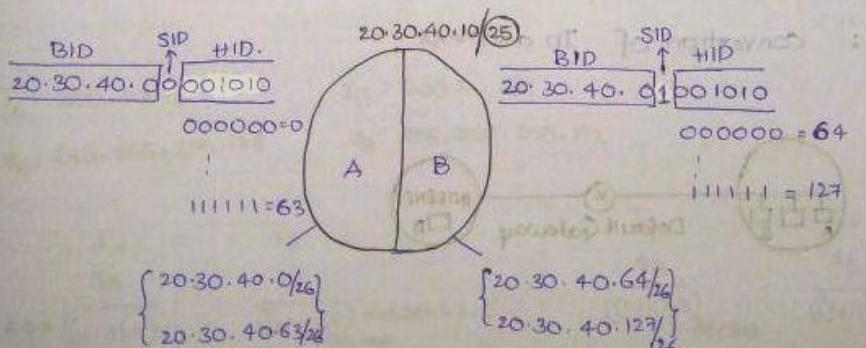

BID

$100 \cdot 1 \cdot 000000010 \cdot 00100011$

$$\underbrace{0000 \cdot 00}_{0} \underbrace{00000000}_{0} = 0 \Rightarrow 100 \cdot 1 \cdot 0 \cdot 0$$

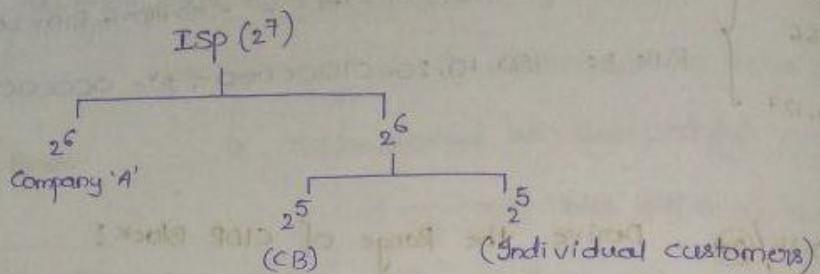

$$\underbrace{11 \cdot 11}_{15} \cdot 11111111 = 100 \cdot 1 \cdot 15 \cdot 255$$

7. SUBNETTING IN CIDR, VLSM IN CIDR

VLSM IN CIDR BLOCKS

i) 20.30.40.10/25

Now, BLK ID
20 30 40: doee 10

$$8 \text{ } 00 \text{ } 0000 = 8$$

$$\begin{array}{c}
 \text{Q} \\
 \text{20.30.40.10/25} \\
 \text{A} \quad \text{B} \\
 \text{Andiv} \\
 \text{custo} \\
 \underline{1} \quad \underline{1} \\
 \text{20.30.40.96/27}
 \end{array}$$

$$CA = 20 \cdot 30 \cdot 40 \cdot 0 / 26$$

$$CB = 20 \cdot 30 \cdot 40 \cdot 64 / 27$$

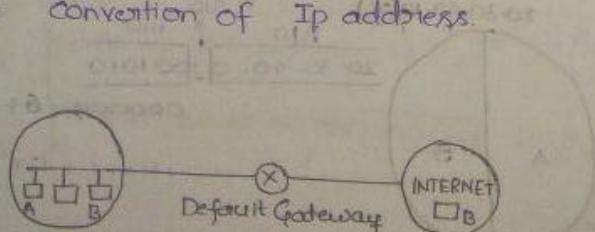

$$customers = 20 \cdot 30 \cdot 40 \cdot 96 / 27$$

8. SOME INTERESTING PROBLEMS ON SUBNET MASK

⇒ subnet mask is sometimes called as "Network mask".

⇒ whenever you open "ipconfig" in your computer you will see these things

- 1> IPv4 Address: provided by ISP
 - 2> Default Gateway: Default Router connected to your n/w.
 - 3> Subnet Mask: subnet mask which you should use
 - 4) DNS: conversion of IP address.

Wireless LAN adapter Wi-Fi:

```
Connection-specific DNS Suffix . :  
IPv6 Address . . . . . : 2401:4900:1bca:b119:c62:9117:27bb:2806  
Temporary IPv6 Address . . . . . : 2401:4900:1bca:b119:f836:e1ad:7553:43c6  
Link-local IPv6 Address . . . . . : fe80::c62:9117:27bb:2806%15  
IPv4 Address . . . . . : 192.168.132.182  
Subnet Mask . . . . . : 255.255.255.0  
Default Gateway . . . . . : fe80::4e6:f5ff:fe5b:c769%15
```

Let I_A = Ip Address of A

I_B = Ip Address of B

S_A = Subnetmask of A

S_B = Subnetmask of B

⇒ Now if you want send a packet from 'A' to 'B' there are 2 cases possible

1: 'B' may be in different network and you want to send first to DGW and

DGW will forward the packet to 'B'

2. 'B' may be in same Network so that you can send the packet directly

Now what 'A' does is

A: I_A

S_A

I_B

S_B

Bitwise AND = $\frac{((NID)_A)}{\text{Acc to A}}$

$\frac{((NID)_B)}{\text{Acc to A}}$

If

$\frac{((NID)_A)}{\text{Acc to A}} = \frac{((NID)_B)}{\text{Acc to A}}$

then A, B are in same NW

$I_A: 200.1.2.10$

$I_B: 200.1.2.130$

$S_A: 255.255.255.128$

Now, $I_A: 11001000.00000001.00000010.00001010$

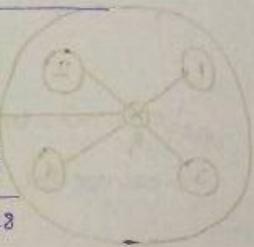

$S_A: 11111111.00000000.11111111.10000000$

$\frac{((NID)_A)}{\text{Acc to A}} = \frac{200.1.2.0}{\text{Acc to A}}$

$I_B: 200.1.2.130$

$S_A: 255.255.255.128$

$\frac{((NID)_B)}{\text{Acc to A}} : 200.1.2.128$

$\frac{((NID)_A)}{\text{Acc to A}} \neq \frac{((NID)_B)}{\text{Acc to A}}$

∴ 'A' assumes that 'B' is in diff Network.

② $I_A: 200.1.2.10$

$I_B: 200.1.2.69$

$S_A: 255.255.255.128$

$S_B: 255.255.255.192$

I_A	I_B
S_A	S_B
$200.1.2.0 \in \frac{((NID)_A)}{\text{Acc to A}}$	$\frac{((NID)_B)}{\text{Acc to A}} \rightarrow 200.1.2.0$

I_B	I_A
S_B	S_A
$200.1.2.64 \in \frac{((NID)_B)}{\text{Acc to B}}$	$\frac{((NID)_A)}{\text{Acc to B}} : 200.1.2.0$

If $\frac{((NID)_A)}{\text{Acc to A}} = \frac{((NID)_B)}{\text{Acc to B}} \Rightarrow 'A' \text{ think } 'B' \text{ is in same NW.}$

$\Rightarrow 'B' \text{ think } 'A' \text{ is in another NW.}$

9. SUPERNETTING OR AGGREGATION

→ If we look at the Routing table, it contains a single entry for all networks, now if the networks are large then the size of the routing table may grow exponentially, so that router takes lot of time to process the Routing table, hence we need to Aggregate / combine / super the Networks.

RULES FOR AGGREGATION

- 1) All the Networks should be contiguous. (Network ID's)
- 2) Size of each Network should be same and in turn they should be in powers of 2.
- 3) 1st Address should be divisible by size of Block

Aggregate the following Networks

1) 200.1.0.0/24

Rule 1: ✓

Total Size of Network = 4×2^3
 $= 2^{10}$

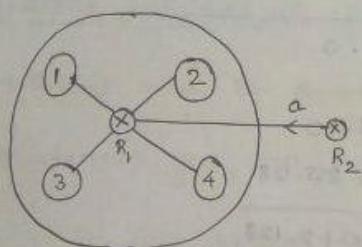

2) 200.1.1.0/24

Rule 2: ✓

3) 200.1.2.0/24

Rule 3: ✓ $200.1.00000000.00000000 \div 2^{10}$
 $= \text{Divisible}$

4) 200.1.3.0/24

The Routing table at R2 looks like

NID	SM	INTERFACE
200.1.0.0	255.255.255.0	a
200.1.1.0	255.256.255.0	a
200.1.2.0	255.255.255.0	a
200.1.3.0	255.255.255.0	a

SUPERNET MASK

Supernet mask : 32 bits

: No of 1's = Fixed part

: No. of 0's = Variable part

FIXED PART	VARIABLE PART
200.1.000000	00.00000000
200.1.000000	01.00000000
200.1.000000	10.00000000
200.1.000000	11.00000000
255.255.111111	00.00000000

$$\text{Supernet mask} = 255.255.252.0$$

Now, the N/w id of the Aggregated N/w is same as the starting IP address
 $= 200.1.0.0/24$ (8)

SHORTCUT TO FIND FIXED AND VARIABLE PARTS

Size of all N/w = $2^3 + 2^3 + 2^3 + 2^3 = 2^{10}$ \Rightarrow Host id part should contain 10 bits
 So BID part contains 2 bits \Rightarrow BID part contains 2 bits

NID SM INTERFACE

\Rightarrow Now, the Routing table at R_2 look like

2)

$100.1.0.0/25$
 $100.1.2.128/26$
 $100.1.2.192/26$

Aggregate them!

\Rightarrow All the Addresses are contiguous ✓, but of diff sizes

\Rightarrow The N/w $100.1.2.128/26$ } These can be aggregated first Rule 1 ✓
 $100.1.2.192/26$ } Rule 2 ✓
 Rule 3 ✓

\Rightarrow Total size of N/w = $2^6 \times 2 = 2^7$ \Rightarrow NID = 7 \Rightarrow NID = 25 bits

\Rightarrow The N/w of the above aggregated N/w = $100.1.2.128/25$ and now combine
 with 1st N/w $100.1.0.0/25$

\Rightarrow $100.1.0.0/25$ } Rule 1 ✓
 $100.1.2.128/25$ } Rule 2 ✓
 Rule 3 ✓

N/w id of Supernet = $100.1.2.0/24$

Supernet mask = 255.255.255.0

Now size of N/w = 2×2^7

$$= 2^8 \Rightarrow \text{NID} = 24, \text{HID} = 8$$

174.17.2.1
 Host $\rightarrow 0000\ 0010\ 0000\ 0000$
 NID $\rightarrow 1111\ 1110\ 0000\ 0000$

The router interface has the following IP address on Ethernet0: 174.17.2.1/23. Which of the following can be valid host IDs on the LAN interface attached to the router?

A 174.17.1.100

B 174.17.1.198

C 174.17.2.255

D 174.17.3.0

Correct Option

Your option is Correct

YOUR ANSWER - d

CORRECT ANSWER - c,d

STATUS - ✅

Solution:

c,d

174.17.2.1/23

174.17.0000010.0000001

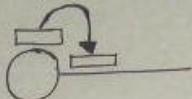

Therefore the host id range is 174.17.2.1 to 174.17.3.254 and thus only option (c) and option (d) are valid.

2. FLOW CONTROL METHODS

DELAYS IN CN (L-1)

TRANSMISSION DELAY (T_t):

The time taken to transmit the packet from a host to the outgoing link is called "transmission delay".

Bandwidth = 1 bps (In one second we can transmit 1 bit to the outgoing link)

Data = 10 bits

$$\Rightarrow \text{Transmission delay} = 10 \text{ sec (for 10 bits)}$$

So, If size of datapacket is 'L' bits and Bandwidth is 'B' bps then the

$$\text{Transmission delay} = \frac{L}{B} \text{ sec}$$

$$T_t = \frac{L}{B} \text{ sec}$$

1) If $L = 1000 \text{ bits}$, $Bw = 1 \text{ Kbps}$ $\Rightarrow T_t = \frac{L}{B} = \frac{1000}{1000} = 1 \text{ sec}$

2) $L = 1 \text{ Kb}$, $Bw = 1 \text{ Kbps}$ $\Rightarrow T_t = \frac{L}{B} = \frac{1024}{1000} = 1.024 \text{ sec}$

DATA

$$K = 1024 \text{ bits}$$

BANDWIDTH

$$K = 1000$$

$$M = 1024 \times 1024$$

$$M = 1000 \times 1000 = 10^6$$

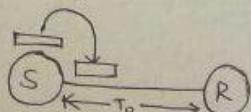

$$G = 1024 \times 1024 \times 1024$$

$$G = 1000 \times 1000 \times 1000 = 10^9$$

LEARN FROM
THIS
MISTAKE

PROPAGATION DELAY (T_p):

The time taken by a bit to reach from one end of the link to other end of the link is called "propagation delay".

The propagation delay depends upon 1) distance

2) Velocity

$$T_p = \frac{d}{V}$$

⇒ In case of optical fibers the speed of the signal is approximately 70% of speed of light $\Rightarrow v = \frac{70}{100} \times 3 \times 10^8 \text{ m/s}$

$$\Rightarrow v = 2.1 \times 10^8 \text{ m/s}$$

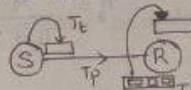

∴ $d = 2.1 \text{ km}$

$$v = 2.1 \times 10^8 \text{ m/s}$$

$$T_p = \frac{d/v}{2} = \frac{2.1 \times 10^3 \text{ m}}{2.1 \times 10^8 \text{ m/s}} = 10^{-5} \text{ sec} = \frac{10^{-5} \times 10^3}{10^3} = 10^{-2} \text{ msec}$$

Now, the total time taken to send a packet from source to Destination = $T_t + T_p$

QUEUING DELAY (T_q):

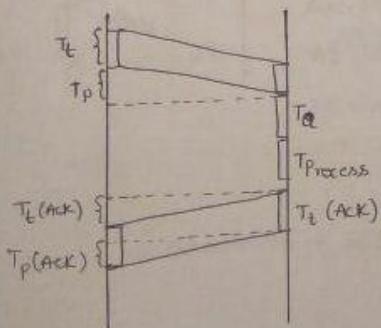

⇒ The amount of time the packet sits in the Queue before it gets processed is called queuing delay (T_q). 

⇒ Whenever the packet is received by the Receiver, it may or may not get immediately processed they are going to sit in Buffer (Queue).

2. FLOW CONTROL STOP AND WAIT

⇒ Stop and wait is the simplest flow control mechanism in which the sender sends a packet and then stop and wait for the acknowledgement from the Receiver, before sending the next packet.

Stop and wait uses 1 bit of sequence number 0 and 1 alternatively.

$$\text{Total time} = T_t(\text{data}) + T_p(\text{data}) + T_q +$$

$$T_p(\text{process}) + T_t(\text{ACK}) + T_p(\text{ACK})$$

$$= T_t(\text{data}) + 2 * T_p + T_t(\text{ACK})$$

$$\boxed{\text{Total time} = T_t + 2 * T_p \text{ for sending 1 packet}}$$

$$\eta = \frac{\text{useful time}}{\text{Total cycle time}} = \frac{T_t}{T_t + 2 * T_p} = \frac{T_t}{T_t(1 + 2 * \frac{T_p}{T_t})} = \frac{1}{1 + 2a} \quad (\text{where } \frac{T_p}{T_t} = a)$$

$$\eta = \frac{T_t}{RTT}$$

File Edit View Insert Tools Help

100 seconds

Transmission time = $\frac{L}{B}$

for 1 frame
 $L = 1024 \times 100 \text{ bytes}$
 $B = 4 \text{ Mbps}$
 $\text{Number of bits} = 1 \times 1024 \times 100 \times 8$
 $T_t = \frac{1024 \times 100 \times 8}{4 \times 10^6} = 1.984 \text{ seconds}$

Frame

100 seconds

Throughput = No. of bits we can send in a second using this protocol

$$\Rightarrow \text{Throughput} / = \frac{L}{T_t + 2 \cdot T_p} \Rightarrow \frac{L \cdot B \times (1/B)}{T_t + 2 \cdot T_p} = \frac{T_t}{T_t + 2 \cdot T_p} * B$$

Effective Bandwidth / Bandwidth utilisation / Link utilisation

$$\Rightarrow \frac{1}{1 + 2\alpha} * B = \eta \times B$$

$\therefore \boxed{\text{Throughput} = \eta \times B}$

1)

$$T_t = 1 \text{ msec}$$

$$\text{Efficiency } (\eta) = \frac{T_t}{T_t + 2 \cdot T_p} = \frac{1}{1+2} = \frac{1}{3}$$

$$T_p = 1 \text{ msec}$$

2)

$$T_t = 2 \text{ msec}$$

$$T_p = 1 \text{ msec}$$

$$\eta = \frac{T_t}{T_t + 2 \cdot T_p} = \frac{2}{2+2(1)} = \frac{2}{4} = \frac{1}{2} = 0.5 = 50\%$$

3) Now if the efficiency has to be 50%, what is the relation between T_t ?

$$\eta = 50\% = \frac{1}{2} \Rightarrow \frac{T_t}{T_t + 2 \cdot T_p} \geq \frac{1}{2}$$

MIN CONTROL STOP AND WAIT

$$\Rightarrow 2 \cdot T_t \geq T_t + 2 \cdot T_p$$

$$\Rightarrow T_t \geq 2 \cdot T_p \Rightarrow \frac{L}{B} \geq 2 \cdot T_p$$

$$\Rightarrow L \geq 2 \cdot T_p \cdot B$$

4) $B = 4 \text{ Mbps}$

$$T_p = 1 \text{ msec}$$

$$L = ? \text{ so that } \eta = \text{atleast } 50\% ?$$

$$L \geq 2 \cdot T_p \cdot B$$

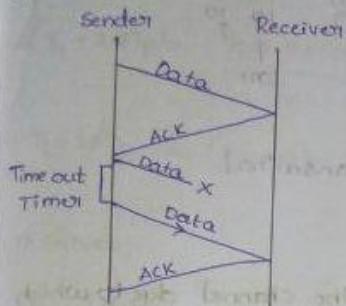

$$L \geq 2 \times 1 \times 10^{-3} \times 4 \times 10^6$$

$$\boxed{L \geq 8 \times 10^3 \text{ bits}}$$

$$\Rightarrow \text{Now, } \eta = \frac{1}{1+2\alpha} = \frac{1}{2 + 2(\frac{TP}{T_E})} = \frac{\frac{1}{2} \cdot \frac{1}{1+\alpha}}{1 + 2 \cdot \frac{d}{V} \cdot \frac{B}{L}} \Rightarrow \boxed{\eta \approx \frac{1}{d}}, \text{ SAW is best for LANs}$$

(10)

67

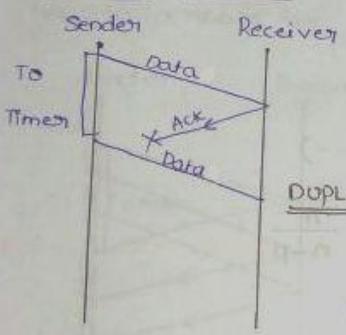

∴ STOP AND WAIT + TIMEOUT TIMER

⇒ STOP AND WAIT ARQ {Automatic Repeat Request}

DATA PACKET LOSS PROBLEM ⇒ {overcome by TOTIMER}

68 ACK LOST PROBLEM

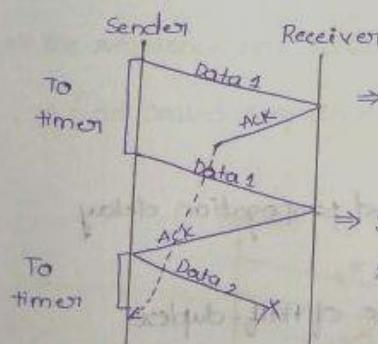

⇒ Acc to sender both the data packets are same but

Acc to Receiver both the packets are different.

DUPLICATE PACKET PROBLEM ⇒ {To overcome this have sequence numbers}

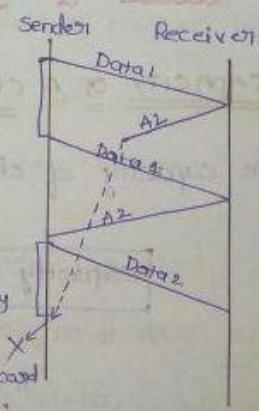

SAW + TOT + SEQ. NO TO DATA PACKET

69 DELAYED ACKNOWLEDGEMENT

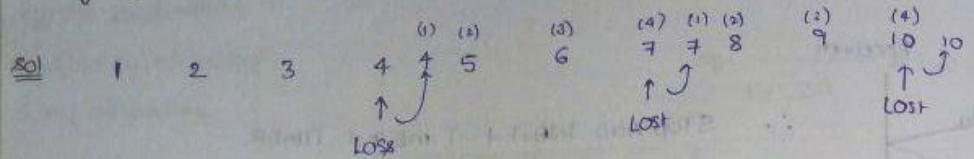

⇒ This problem can be overcome by having Seqno on ACK also.

⇒ If the Receiver receives D1 successfully then it sends ACK A2 which means {"I have successfully received D1, please send D2"}

⇒ SAW + TOT + SEQ. NO TO DATA AND ACK

8) Using SAW we have to send 10 packets from Sender to Receiver of which every 4th packet is lost then how many packets are we going to send totally?

$\therefore \text{Total} = 13$, (4,7,8) \rightarrow packets are Retransmitted

9) $S \rightarrow R$, Now there are some problems in the channel due to which some of bits are lost, let us say error probability of channel is $0.2 = 20\%$. Now if I send 400 packets, then how many packets are transmitted totally.

$$\text{sol} \Rightarrow 400 + 400(0.2) + [400(0.2)](0.2) + \dots$$

$$\Rightarrow n + np + np^2 + \dots \Rightarrow n(1+p+p^2+p^3+\dots)$$

$$\Rightarrow n \left(\frac{1}{1-p} \right) = \frac{n}{1-p}$$

Here $n=400$, $\frac{400}{1-0.2} = \frac{400}{0.8} = \frac{4000}{8} = 500$ packets totally.

3. CAPACITY OF PIPE AND PIPELINING

CAPACITY OF A CHANNEL / WIRE / LINK

The capacity of channel depends on Bandwidth and propagation delay

Capacity of the channel = $BW \times TP$ Increase of half-duplex

Capacity = $2 \times BW \times TP$ \Rightarrow Increase of full duplex

Pipelining

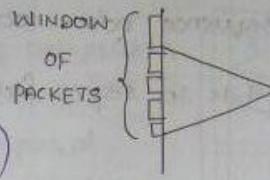

T_t sec = 4 packets

$1.8 \text{ sec} = \frac{1}{T_t}$ packets

} Now time taken to transmit one packet of data in Stop-and-wait protocol is $T_t + 2 \cdot T_p$. Now,

$$\Rightarrow (T_t + 2 \cdot T_p) = \frac{T_t + 2 \cdot T_p}{T_t} \text{ packets}$$

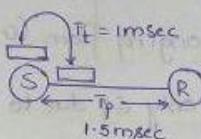

$$\Rightarrow T_t + 2 \cdot T_p = (1 + 2a) \text{ packets } (a = T_p/T_t)$$

Given,

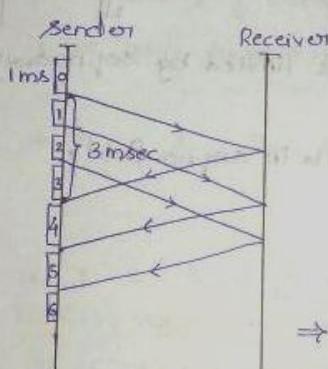

$$T_t = 1 \text{ msec}$$

$$T_p = 1.5 \text{ msec}$$

$$\Rightarrow \eta = \frac{T_t}{T_t + 2 \cdot T_p} = \frac{1}{1 + 2(1.5)} = \frac{1}{4} = 25\%$$

Now to increase the efficiency of stop-and-wait protocol,

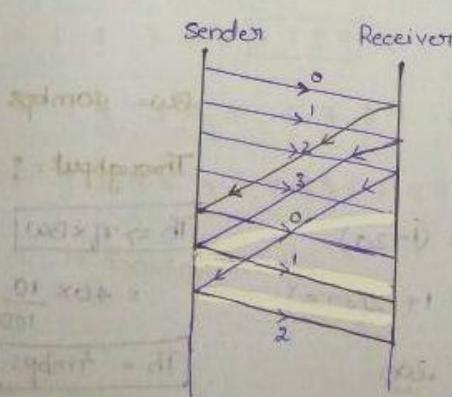

$$\boxed{\text{Round-trip time} = 2 \cdot T_p}$$

\downarrow
Yet to be Transmitted Already Transmitted and Acknowledged

\Rightarrow The sender window size in sliding window

$$\boxed{\text{Protocol} = w_s = 1 + 2a}$$

\Rightarrow The sequence nos have to be stored in the header field of packets in a field called sequence no. field.

$$\Rightarrow \text{Min. no. of sequence nos} = 1 + 2a$$

$$\Rightarrow \text{Min. no. of bits in seq. no. fields} = \lceil \log_2 (1 + 2a) \rceil$$

$$\Rightarrow n \log_2 k (1 + 2a)$$

$$\Rightarrow n = \lceil \log_2 (1 + 2a) \rceil$$

$$\text{NOT } \frac{01}{001}$$

$\Rightarrow T_t = 1 \text{ ms}$ } what is the sender window size to get max efficiency?
 $T_p = 49.5 \text{ ms}$

$$\text{so } w_3 = 1+2a \Rightarrow 1+2\left(\frac{7}{10}\right) = 1+2(49.5) = 100$$

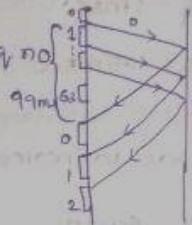

Min. no. of sequence nos. = 100 = $(1 + 2a)$

$$\text{Min no. of bits in seq.no field} = \lceil \log_2(1+2^a) \rceil = \lceil \log_2(100) \rceil = 7,$$

⇒ Now, in the above problem if the min.no.of bits in Seq.no field is "6", then we can get 64 Seq.no(2^6) ranging from (0-63)

$$\Rightarrow \eta = \frac{64}{100} \longrightarrow \text{But I am sending only 64 due to lack}$$

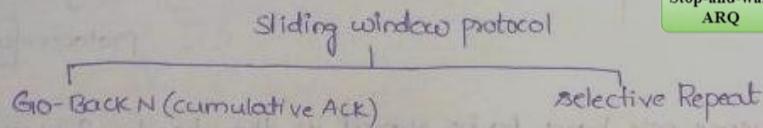

↳ I can send 100 packets in the time available

∴ The window size in the stop and wait protocol is limited by Seq.no available

$$\therefore (w_s = \min(1+2n, 2^n)) \quad \{ n = \text{no. of bits in seq.no field} \}$$

~~GO BACK - N~~ (L-4)

GOBACK-N = (N>1)

i) Sender window size in GBN is "N"

$$T_L = \text{Im} \sec$$

$$T_p = 49.5 \text{ msec}$$

GOBACK - 10

$$\text{Max window size} = (1 + 2\alpha)$$

$$= 1 + 2(49.5)$$

≈ 4.00

Bw = 40mbps

Throughput = ?

$$Th \Rightarrow \eta \times Bw$$

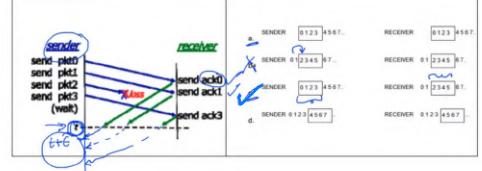

$$= 40 \times \frac{10}{100}$$

$$Th = 4 \text{ mps}$$

$$\pi_0 = \frac{10}{100} = 10\%$$

[Medium]

[medium]
Que: 3 Consider the given figure. Suppose the sender and receiver windows are of size $N = 4$ and suppose the sequence numbers go from 0 to 15. What are the positions of the sender and receiver windows at time t.

Q14 Consider a selective repeat sliding window protocol, the window size of the sender is 64. What will be the sequence number for the 500th frame?

Time taken to answer this question 00:00:53 hrs
 Subject: Computer Networks
 Your Answer: 115
 Correct Answer: 115
 Solution: 115

Window size of selective repeat: $2^n - 1 = 64$.
 So, $n = 6$
 In 7 bits possible sequence number = 128 = 0 to 127
 For first 128 frames: 0 to 127
 For next 128 frames: 0 to 127
 For next 128 frames: 0 to 127
 Up to then 384 frames completed transmission.
 Left 116 frames out of 350 = 0 to 115.
 Hence 115 is the sequence number for the 500th frame.

I saw 500th frame and you got of 115 frame. But, Marked 115

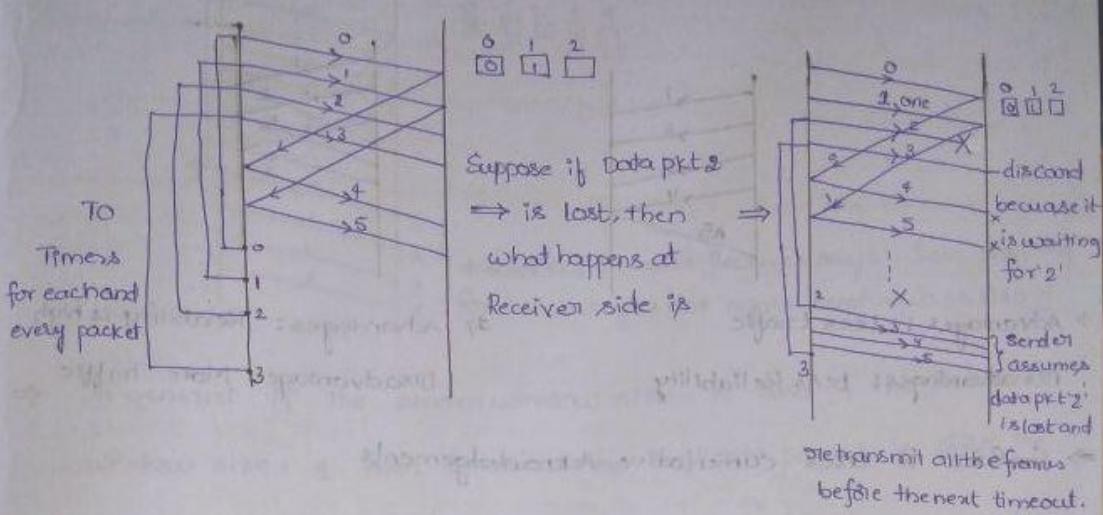

Minute Difference
 If the sender Window size is 128 using selective repeat ARQ. Then the sequence number of frame to be sent after sending 400th frame is ?

Subject: Computer Networks
 Your Answer: 115
 Correct Answer: 115
 Solution: 115

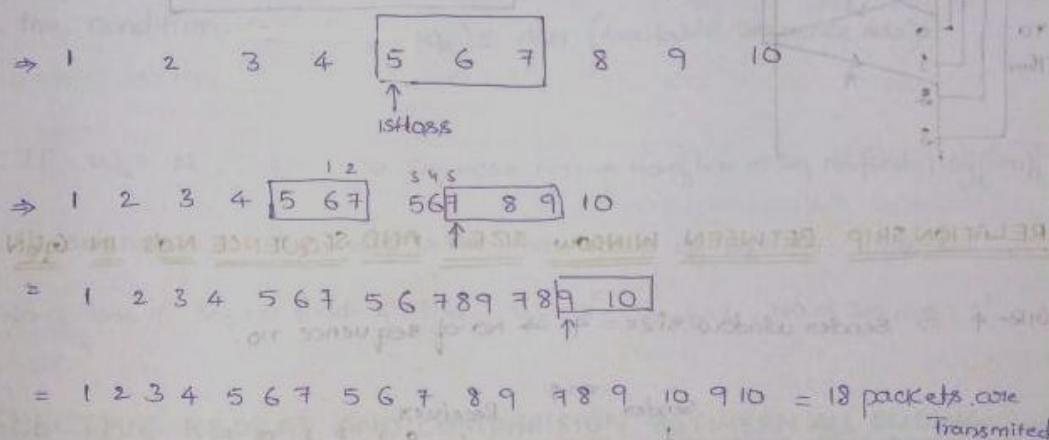

For selective repeat ARQ, we know that sender window size = receiver window size and total no of sequence numbers = $2N$ (where N is the sender window size).
 Total sequence number = $2^6 = 64$
 Hence 0-63 would be consumed for sending 64 frames.
 0-143 = 144 frames
 400 frames completed.
 After 400 the frame the sequence number would be 144

I forgot to double window size for SR.

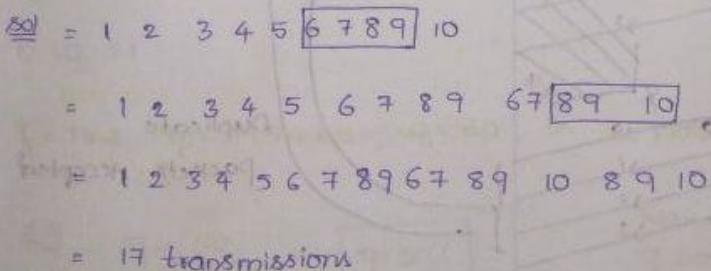

2) Receiver window size:

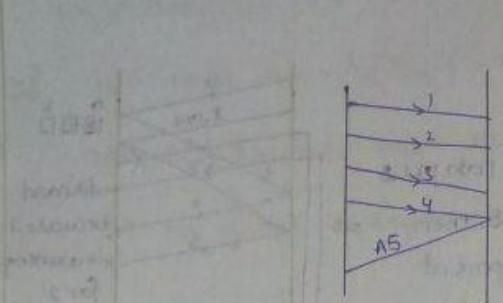

3) In GoBack-3 if every 5th packet that is being transmitted is lost and if we have to send 10 packets, then how many transmissions are required?

4) GIB-4, Every 6th packet is lost, I should send 10 packets, how many transmissions?

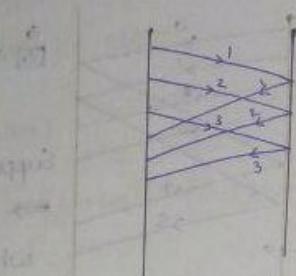

5) Acknowledgements: There are 2 kinds of ACK
 1) Cumulative ACK
 2) Independent ACK

Advantages: Less traffic

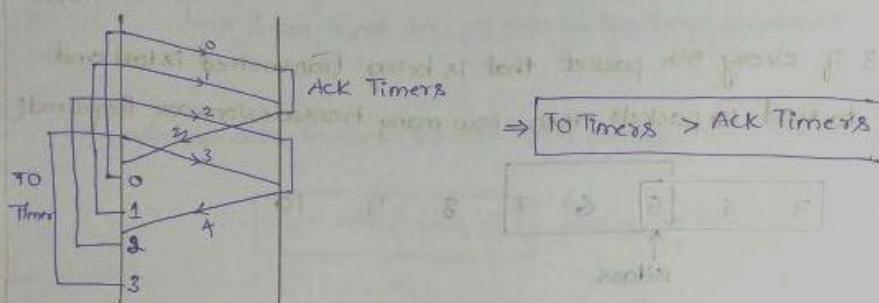

Disadvantages: Less Reliability

Advantages: Reliability is high

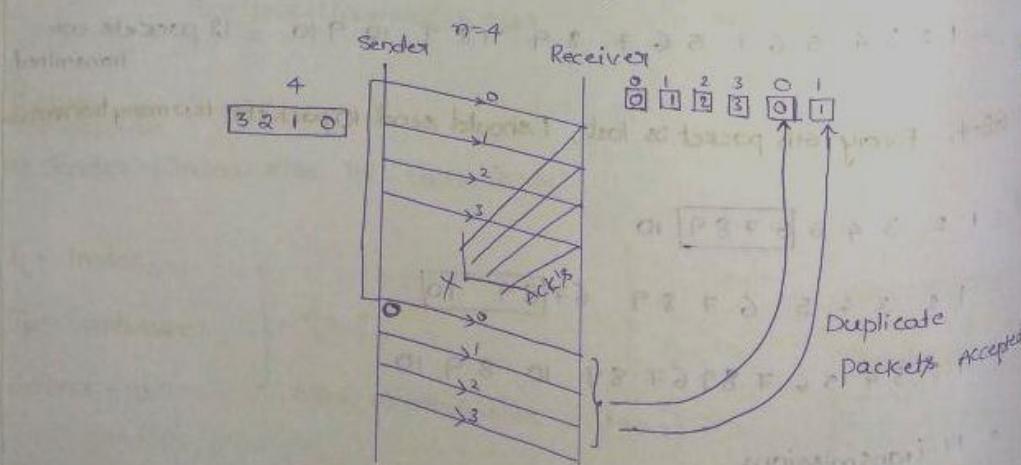

Disadvantage: More Traffic

⇒ GoBack-N uses cumulative Acknowledgements.

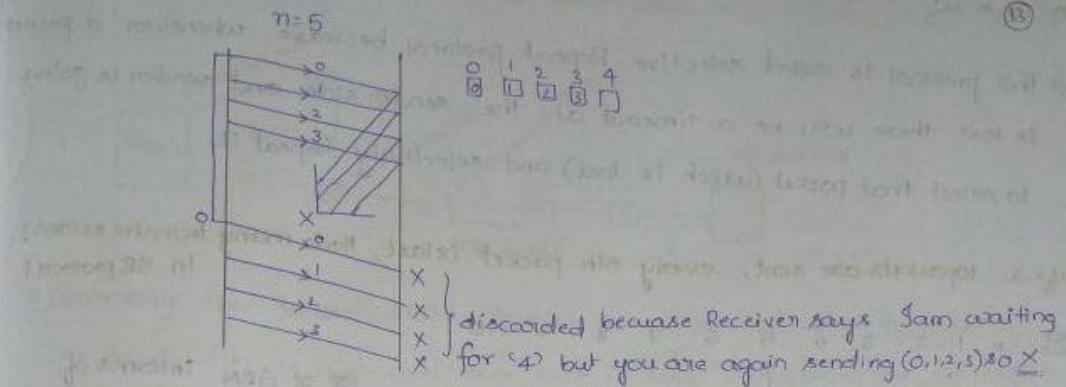

RELATIONSHIP BETWEEN WINDOW SIZES AND SEQUENCE NOS IN GBN

GBN-4 ⇒ Sender window size = 4 ⇒ No of sequence no.

∴ This scenario ⇒ (having the sequence nos = window size) don't work

2) GB-4 , N=5 (Seq. Nos.)

\Rightarrow In general if the sender window size = 'N' and if the Receiver window size = 1 then to detect the Duplicate packets in GBN the No. of Seq. nos. should be $(N+1)$.

→ In any sliding window protocol if it has to work without any problem the condition is $(w_s + w_r) \leq ASN$ (Available Sequence nos).

\Rightarrow If $w_S = N$, $w_R = 1 \Rightarrow \text{Seq. No.} = N+1 \Rightarrow \text{No. of bits in seq. no. field} = \lceil \log_2(N+1) \rceil$

\Rightarrow If $\text{Seq NDs} = N$ then what is the max value of $w_2 = N-1 \quad w_2 = 1$

\Rightarrow No. of bits in Seq No field = K then $w_1 = 2^K - 1$, $w_2 = 1$, No. of Seq Nos = 2^K

5. SELECTIVE REPEAT AND COMPARISON BETWEEN ALL SLIDING

WINDOW PROTOCOLS

18 >

$T_f = 1 \text{ msec}$, $T_p = 19.5 \text{ msec}$, $w_2 = 50$, In SR-protocol $\eta_b = ?$

$$\underline{\underline{50}} \quad \eta = \frac{50}{100} \Rightarrow \boxed{\eta = 50\%}$$

$$\text{Max window size} = 1 + 2a$$

of sender = $1 + 2(49.5)$

$$BW = 4 \text{ Mbps} \Rightarrow \text{Throughput} = \eta \times BW \\ = \frac{1}{2} \times 4 = 2 \text{ Mbps}$$

$$w_r = w_s$$

⇒ This protocol is called Selective Repeat protocol, because whenever a packet is lost there will be a timeout at the sender side and sender is going to select that packet (which is lost) and selectively repeat it.

$w_g = 3$, 10 packets are sent, every 5th packet is lost, How many transmissions in SR protocol?

$$\underline{seq} = 1 \ 2 \ 3 \ 4 \ 5 \ 6 \ 7 \ 8 \ 9 \ 10$$

$SR \cong$

$$= 1 \ 2 \ 3 \ 4 \ 5 \ 5 \ 6 \ 7 \ 8 \ 9 \ 9 \ 10$$

$SR \cong$

$$= 1 \ 2 \ 3 \ 4 \ 5 \ 5 \ 6 \ 7 \ 8 \ 9 \ 9 \ 10$$

= 12 transmissions

Properties	Stop and Wait	Go Back N	Selective Repeat
Sender window size	1	N	N
Receiver Window size	1	1	N
Minimum Sequence number	2	N+1	2N
Efficiency	$1/(1+2^a)$	$N/(1+2^a)$	$N/(1+2^a)$
Type of Acknowledgement	Individual	Cumulative	Individual
Supported order at Receiving end	-	In-order delivery only	Out-of-order delivery as well
Number of retransmissions in case of packet drop	1	N	1

3) The ACK rule independent in SR-protocol

⇒ In case of packet loss both GBN and SR protocol behaves same way but in case of corrupted Data packets SR is going to send "NACK" (Negative Acknowledgement).

Efficiency	<u>SAW</u> $\frac{1}{(1+2^a)}$	<u>GBN</u> $\frac{N}{(1+2^a)}$
		<u>SR</u> $\frac{N}{(1+2^a)}$ → Sender window size

Buffers

Sequence Numbers	$1+1=2$	$N+1$
		$(N+N)=2N$

Retransmissions (1 packet is lost)	1	N
		1

Bandwidth	Low	High (More Retrans)
		Moderate

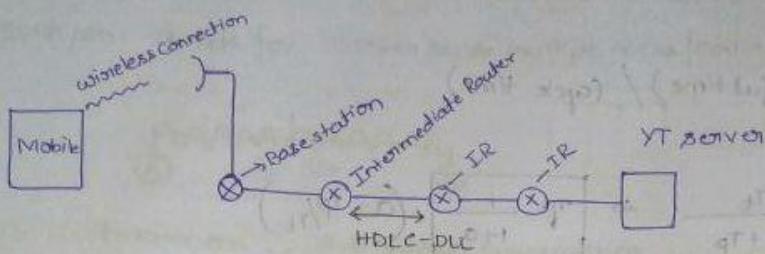

CPU	Low	Moderate
		High

Implementation	Easy	Moderate
		Difficult/complex

⇒ The maximum window size for data transmission using Selective Reject protocol with n-bit frame sequence numbers is 2^{n-1} .

PRACTICAL SCENARIO WHERE SR AND GBN ARE USED

(14)

- ⇒ Generally the Intermediate Routers are connected with Thick wires.
- ⇒ Bandwidth is high and error rate is low, out of order are not possible, CPU's are powerful and there are always busy in processing the pkts
- ⇒ The availability of CPU is very less.

⇒ For all the above scenarios GBN is used.

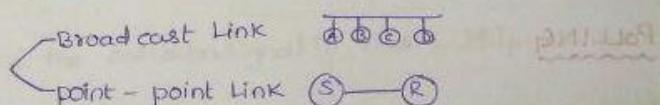

- ⇒ When we consider near our mobile phone / Laptop, Error rate ↑, BW ↓ and out of order packets are possible, CPU is available: CPU ↑

⇒ SR protocol is used.

∴ Link to Link protocols like HDLC-(DLC) uses "GBN".
End to End protocols like TCP - uses - "SR" TCP-(Transport Layer)

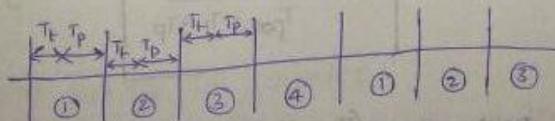

6. INTRODUCTION TO ACCESS CONTROL METHODS, TDM, POLLING

The are two types of Links

TDM

- ⇒ TDM stands for Time Division Multiplexing.
- ⇒ Divide the timeline into slots and allot a station to each slot in Round Robin manner.

$$\eta_b = (\text{cycle time})^{-1} \times (\text{useful time})$$

$$\eta = (\text{useful time}) / (\text{cycle time})$$

$$\eta = \frac{T_t}{T_t + T_p} \Rightarrow \boxed{\eta = \frac{1}{1+a}} \quad (a = T_p/T_t)$$

If $T_t = 1\text{msec}$ and η_b of TDM: $\eta_b = \frac{1}{1+a} = \frac{1}{1+1} = \frac{1}{2} = 50\%$
 $T_p = 1\text{ms}$

$BW = 4\text{Mbps}$ Throughput = $\eta \times BW = \frac{1}{2} \times 4 = 2\text{Mbps}$.

Now, if 'N' stations are connected to the channel and each station
 Requisite 2kbps BW then what is the max value of N?

$$\Rightarrow N * 2\text{kbps} = 2\text{Mbps}$$

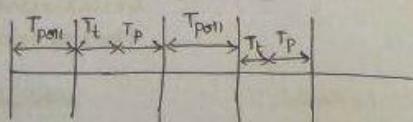

$$\Rightarrow \boxed{N = 1000}$$

Disadvantages

1. The problem with Reservation method in TDM is, whenever you reserve a slot for a station, the station might not use it completely the reason is it is not always true that every station might have data to transmit then the slot allotted will be wasted.

INTRODUCTION TO ACCESS CONTROL METHODS: TDM, POLLING

POLLING

$$\eta = (\text{useful time}) / \text{cycle time}$$

$$\eta = \frac{T_t}{T_{poll} + T_t + T_p}$$

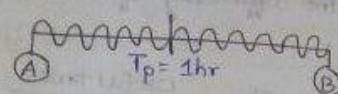

$$\boxed{\eta_b = \frac{T_t}{T_{poll} + T_t + T_p}}$$

$$\text{Throughput} = \eta \times BW$$

\Rightarrow The disadvantage is the polling time (T_{poll}). Before transmitting we should actually construct polling.

1. CSMA/CD

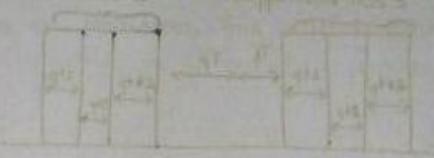

→ The CSMA/CD stands for carrier sense multiple Access / collision Detection.

t = 10:00 AM, A, B starts transmitting

t = 10:30 AM, collision

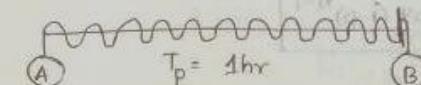

t = 11:00 AM, collision signals observed by A/B

→ Now, if A/B must be **sure** about their data (mean whether the data that they are transmitting, got collided or others data) the condition is

$$T_t > T_p$$

⇒ At worst case, if A starts transmitting at 10:00 AM after how much time will A' get the collision signal back.

10:00:00 AM, A starts transmitting

10:59:59 AM, B starts transmitting

11:00:00 AM, collision

12:00:00 AM, A sees the collision signal.

∴ The time at which A sees the collision signal is $2 \text{ hrs} = 2 * T_p$

∴ If A has to detect collision (be sure about whether its own data) got collided or others data) it should still be transmitting the data in worst case also

$$\Rightarrow T_t > 2 * T_p \Rightarrow \frac{1}{B} > 2 * T_p$$

$$\Rightarrow L > 2 * T_p * B = \text{This is the min size of packet to detect collision}$$

⇒ There are NO ACK in CSMA/CD

⇒ CSMA/CD is used in Ethernet & IEEE 802.11 wireless LAN

Consider a 10 Mbps Ethernet LAN that has stations attached to a 2.5 km long coaxial cable. Given that the transmission speed is $2.3 \times 10^8 \text{ m/s}$, the packet size is 128 bytes out of which 30 bytes are overhead, the 'A' effective transmission rate and 'B' maximum rate at which the network can send data. Find A+B in Mbps?

Time taken to answer this question is 00:00:20 hrs

[Hide Answer](#) [Add Note](#) [View Notes](#) [Close Comment](#)

Solution: 0.44

Ans : 10.44
Sol: In effective Transmission you can consider the overhead, as it is effectively given otherwise it will be given as negligible.

And in the Maximum Transmission Rate just discard that overhead and take the Ideal Situation.

Prop.Delay * length / speed = $(2.5 \times 10^3 \text{ m}) / (2.3 \times 10^8 \text{ m/s}) = 10.8 \mu\text{sec}$

Trans.Delay* data size / Bandwidth = $128 \text{ B} / 10 \text{ Mbps} = 102.4 \mu\text{sec} = 0.1024 \text{ ms}$

$\alpha = T_d / T_r = 10.8 \mu\text{sec} / 102.4 \mu\text{sec} = 0.108$

Efficiency(η) = $1 / (1 + 0.44 \times \alpha) = 0.59 = 59\%$

Maximum rate or Throughput = Efficiency * Bandwidth = $0.59 \times 10 \text{ Mbps} = 5.9 \text{ Mbps}$

Effective transmission rate = Throughput $\times (128 - 30) / 128 = 5.9 \text{ Mbps} \times (0.9 / 128)$

= $0.77 \times 5 \text{ Mbps} = 3.85 \text{ Mbps}$

A+B = 10.44

Why do different models need to have many other nodes are checking the sentence to make effective use of GPT4?

1. GPT4 is trained on a massive amount of text data, which includes many examples of sentences that contain multiple errors or contradictions. By having many other nodes check the sentence, the model can learn to identify patterns and rules for detecting and correcting these types of errors.

2. GPT4 is a language model, not a proofreader. It is designed to generate text that is semantically similar to the input, but it may not always produce grammatically correct or logically consistent text. Having multiple nodes check the sentence helps to catch these types of errors and ensure that the final output is more accurate and reliable.

3. GPT4 is trained on a wide variety of text data, including news articles, academic papers, and other types of written communication. By having many other nodes check the sentence, the model can learn to identify the types of errors that are most common in these different contexts, and adjust its behavior accordingly.

4. GPT4 is a large and complex model, and it is not always perfect. By having multiple nodes check the sentence, the system can catch errors that individual nodes might miss, and improve the overall quality of the generated text.

5. GPT4 is a language model, not a proofreader. It is designed to generate text that is semantically similar to the input, but it may not always produce grammatically correct or logically consistent text. Having multiple nodes check the sentence helps to catch these types of errors and ensure that the final output is more accurate and reliable.

6. GPT4 is a large and complex model, and it is not always perfect. By having multiple nodes check the sentence, the system can catch errors that individual nodes might miss, and improve the overall quality of the generated text.

7. GPT4 is a language model, not a proofreader. It is designed to generate text that is semantically similar to the input, but it may not always produce grammatically correct or logically consistent text. Having multiple nodes check the sentence helps to catch these types of errors and ensure that the final output is more accurate and reliable.

8. GPT4 is a large and complex model, and it is not always perfect. By having multiple nodes check the sentence, the system can catch errors that individual nodes might miss, and improve the overall quality of the generated text.

9. GPT4 is a language model, not a proofreader. It is designed to generate text that is semantically similar to the input, but it may not always produce grammatically correct or logically consistent text. Having multiple nodes check the sentence helps to catch these types of errors and ensure that the final output is more accurate and reliable.

10. GPT4 is a large and complex model, and it is not always perfect. By having multiple nodes check the sentence, the system can catch errors that individual nodes might miss, and improve the overall quality of the generated text.

Q7
We can transmit with probability 0.4 in the P-persistent CSMA. If 12 stations are there in the competition. What is the chance that only one station would successfully transmit the frame? [Note: Write your answer correct up to three places of decimal]

Time taken to answer (00:01:40). Avg

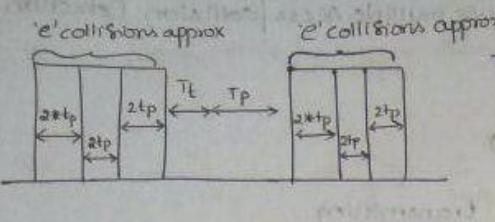

Solution: 0.017
Ans: 0.017

Sol: In P persistent CSMA station can transmit with probability P and also not transmit with probability $(1 - P)$.

$$\begin{aligned}P &= 12 \times C_1 \times P^{\alpha-1} \\&= 12 \times (0.4)^1 \times (0.6)^{11} \\&= 12 \times 0.4 \times 0.0036 = 0.017\end{aligned}$$

Your Answer is wrong (0.0174)

EFFICIENCY OF CSMA/CD / ETHERNET

The efficiency of CSMA/CD

$$\eta = \frac{\text{useful time}}{\text{cycle time}}$$

$$\eta = \frac{T_t}{[C * 2 * t_p] + T_t + t_p} \rightarrow \eta_b = \frac{\text{Transmission delay}}{[(\text{No. of contention slots}) * 2 * P_D] + T_D + P_D}$$

- 1) If there are 'n' stations connected to CSMA/CD and every station wants to send the data with probability 'p'.

Now, There will be a successful transmission if only one station transmits the data and other stations Refrain = play for successful trans.

$$P_{\text{success}} = n_q p * (1-p)^{n-1}$$

$$P_{\text{success}} = np * (1-p)^{n-1}$$

$$\text{Throughput of Munt} = p \cdot (1-p)^{n-1}$$

Now, $\frac{dp_{\text{success}}}{dp} = 0 \Rightarrow p = \frac{1}{m}$ At value of $p = \frac{1}{m}$ the success probability will be maximum.

$$\Rightarrow P_{\max} = (1 - \lambda_n)^{n-1}$$

$$\text{Now, } \lim_{n \rightarrow \infty} \left(1 + \frac{1}{n}\right)^{n-1} = \frac{1}{e}$$

- 2) No. of tries or times we should try before getting first success = $\frac{1}{P_{\max}} = \frac{e}{P_{\max}}$

$$\eta = \frac{T_t}{e * 2 * T_p + T_t + T_l}$$

$$\eta = \frac{1}{1 + 6.44\alpha}$$

$$\left(a - \frac{T_P}{T_E} \right) \rightarrow \eta$$

CAUTION

**SILLY
MISTAKES**

⇒ The max amount of data that can be sent through Ethernet = 1500 Bytes

$\Rightarrow \eta_b \downarrow$ as $d \uparrow$ { NOT SUITABLE FOR WANS }

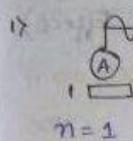

$\Rightarrow \eta \uparrow$ as $L \uparrow$ {Send Bigger ptn for good efficiency}

in this
in CSMA/CD
or Ethernet
not $\left(\frac{1}{1+2a}\right)$

8. BACK OFF ALGORITHM FOR CSMMA-CD

(16)

⇒ The Back-off Algorithm is used to give waiting time of a station before it starts Retransmitting after involved in a collision. This waiting time is called Backoff time.

$n = \text{collision Number}$

$$\Rightarrow (0, 2^n - 1)$$

$$\Rightarrow (0, 2^n - 1)$$

$$\Rightarrow (0, 1)$$

$$\Rightarrow (0, 1)$$

⇒ This Algo says both the stations 'A' and 'B' should randomly choose a no between $(0 \times 2^n - 1)$

∴ A B

$$0 \rightarrow A's \text{ waiting time} = 0 * T_{\text{slot}} = 0$$

$$1 \rightarrow B's \text{ waiting time} = 1 * T_{\text{slot}} = T_{\text{slot}}$$

0

0

1

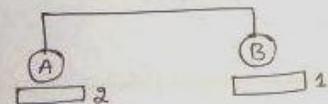

1

1

1

$$\left. \begin{array}{l} \text{collisions} \\ p(A) = \frac{1}{4} \quad p(B) = \frac{1}{4} \quad p(\text{collision}) = \frac{1}{2} \end{array} \right\}$$

Now, suppose let us Assume 'A' wins the Back-off Race \Rightarrow 'A' has successfully transmitted its 1st Data packet and is steady with 2nd Data packet

$n=1$

$n=2$

$$= (0, 2^n - 1)$$

$$= (0, 2^n - 1)$$

$$= (0, 1)$$

$$= (0, 3)$$

$$\Rightarrow (0, 1)$$

$$(0, 1, 2, 3)$$

A B

0 0 \Rightarrow collision

0 1 \Rightarrow 'A' win

0 2 \Rightarrow 'A' win

0 3 \Rightarrow 'A' win

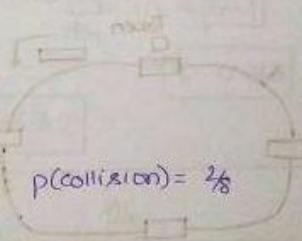

1 0 \Rightarrow 'B' win

1 1 \Rightarrow collision

1 2 \Rightarrow 'A' win

1 3 \Rightarrow 'A' win

CHOOSE \rightarrow min

$$P(A) = \frac{5}{8} \quad P(B) = \frac{1}{8} \quad P(\text{collision}) = \frac{2}{8}$$

$(1 \times 1) + \frac{1}{4} = \frac{5}{4}$ - probability of collision

$(1 \times 1) + \frac{1}{4} = \frac{5}{4}$ - probability of success

$$\Rightarrow \text{Waiting Time} = K \times T_{slot} \quad K \in (0, 2^n - 1) \quad n = \text{collision number}$$

\Rightarrow collision probability is decreasing exponentially.

\Rightarrow If 'A' has won first collision the prob that it wins 2nd collision is high
(capture effect)

\Rightarrow Applicable only for 2 stations.

\Rightarrow Binary Backoff Algo or Binary exponential Backoff Algo.

9. TOKEN PASSING ACCESS CONTROL METHOD

• When Time is given in Bits

$$\text{Bits} \rightarrow \text{Seconds} \quad \div \text{BW}$$

• When Time is given in Meters

$$\text{Meters} \rightarrow \text{seconds} \quad \div \text{velocity}$$

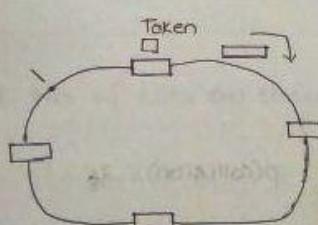

$$\begin{array}{c} * \text{velocity} \\ \text{Meters} \rightarrow \text{seconds} \quad \div \text{velocity} \\ * \text{BW} \\ \text{Bits} \quad \div \text{BW} \end{array}$$

How many meters 10 bits Equivalent to, given that BW = 4Mbps, $v = 2 \times 10^8 \text{ m/s}$

Sol: Bits = 10bits

$$\frac{\text{Bits}}{\text{BW}} = \frac{10}{4} = \frac{2.5 \text{ sec}}{10^6} * 2 \times 10^8 \text{ m/s} \\ = \frac{5 \times 10^8 \text{ m}}{10^6}$$

Ans = 500m

1. Unidirectional flow of data

2. only one station can transmit at a time

3. If i leave a bit at some point in the ring the time taken by it to take one complete

Rotation is called "RING LATENCY".

$$\text{Ring latency} = \left(\frac{d}{v} \right) + (N * b) \quad \text{delay} \quad \begin{cases} d = \text{length of Ring} \\ v = \text{velocity} \end{cases}$$

No. of stations

$$\text{Ring Latency} = \frac{d}{v} + \frac{(N * b)}{\text{BW}}$$

seconds (m)

$$RL = \frac{d}{v} * \text{BW} + \frac{N * b}{\text{BITS}}$$

THT = Token Holding time $\geq T_{HT}$ is time for which each station holds the token

(17)

$$\text{Cycle time} = \frac{d}{v} + (N * THT) = T_p + (N * THT)$$

$$\eta = \frac{N * T_p}{T_p + (N * THT)}$$

There are two strategies that are present in token passing mechanism they are

i) Delayed Token Reinsertion $\Rightarrow THT = T_t + T_p \Rightarrow \eta_b = \frac{1}{1 + \frac{(N+1)}{N} a} \quad (a = T_p/T_t)$

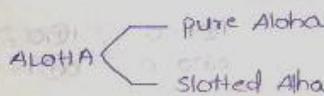

ii) Early token Reinsertion $\Rightarrow THT = T_t \Rightarrow \eta_b = \frac{1}{1 + (a/N)}$

10. ALOHA AND DIFFERENCES BETWEEN CLOW AND ACCESS CONTROL

i) Any station could transmit data at any time - No carrier sensing.

ii) collisions are possible, acknowledgements are there \Rightarrow collision detection X

iii) Retransmissions ✓ after some time (Backoff time)

Q2
Groups of user stations(N) share a 56Kbps pure aloha channel. Each station outputs a 1000 bits frame on an average of once every 200sec (stations are buffered). What is the max value of N?

Sol: With pure ALOHA, the usuable bandwidth is $0.184 \times 56 = 10.3$ kbps.
Each station sends 1000bits
So in 1 sec each station sends $= 1000/100 = 10$ bps
, so Max number of stations possible $= 10.3$ kbps / 10bps = 1030 stations.
N

Hide Answer | Add Notes | View Notes | Show Comments | Correct Answer

pure Aloha

$$\Rightarrow \text{Vulnerable time} = 2T_t$$

$$\Rightarrow \eta = G_1 * e^{-2G_1} \quad (G = \text{No of stations})$$

who wants to transmit in 1 slot

$$\Rightarrow \frac{d\eta}{dG} = 0 \Rightarrow G_1 = \frac{1}{2}$$

If $G_1 = \frac{1}{2}$ $\eta = \max$

$$\Rightarrow \eta_{\max} = \frac{1}{2} * e^{-1}$$

$$\therefore \eta_{\max} = 0.184$$

$$\therefore \eta_{\max} = 18.4\%$$

Slotted Aloha

$$\Rightarrow \text{Vulnerable time} = T_t$$

$$\Rightarrow \eta_b = G_1 * e^{-G_1} \Rightarrow \frac{d\eta_b}{dG_1} = 0 \Rightarrow G_1 = 1$$

$$\Rightarrow \eta_b = 0.368$$

$$\eta_{\max} = 36.8\%$$

FC

$$\text{SAW} = \frac{1}{(1+2a)}, \text{SOP} = \frac{N}{(1+2a)}$$

$$\text{GRN} = \frac{N}{(1+2a)}$$

$$\text{SR} = \frac{N}{(1+2a)}$$

AC

$$\text{TOM} = \frac{1}{1+a}, \text{Polling} = \frac{T_t}{T_t + T_{poll}}$$

$$\text{CSMA/CD} = \frac{1}{1+6.44a}$$

$$\text{Aloha} \left[\begin{array}{l} \text{Pure} \\ G_1 * e^{-2G_1} = 18.4\% \\ \text{Slotted} \\ G_1 * e^{-G_1} = 36.8\% \end{array} \right]$$

5. LAN-TECHNOLOGIES

ETHERNET (IEEE 802.3)

- 1) Topology: Bus topology
- 2) Access control method: CSMA/CD
- 3) No Acknowledgement
- 4) Data Rates (Bandwidth): 10Mbps — 100Mbps — 1Gbps
 (Fast Ethernet) (Gigabit Ethernet)
- 5) Encoding technique: Manchester Encoding (Band Rate = 2 * Bit Rate)
- 6) "Ethernet" operates at Data Link Layer. (LAN technologies are dealt at DLL)

AL = Message

TL = Segment

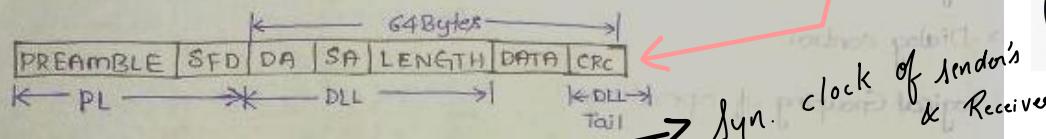

NL = Datagram

DLL = Frame

PL = Single protocol Data Unit. (I-PDU)

Gate 2006

FRAME FORMAT OF ETHERNET (OR) IEEE 802.3 FRAME FORMAT

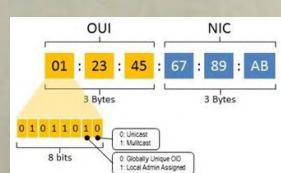

PREAMBLE: 7bytes : 10 10 10 10 10 ----- 10 → used to alert all the stations

SFD: [Start frame Delimiter]: 1Byte : 10 10 10 11 → Indicate Start of frame, Synchronization.

DA: 6Bytes } MAC Address

SA: 6Bytes

CRC: 4 Bytes

Ex: 1A:2B:3C:4D:5E:6F

1. UNICAST MAC ADDRESS: [LSB of 1st byte is 0] 00011010:00101011:

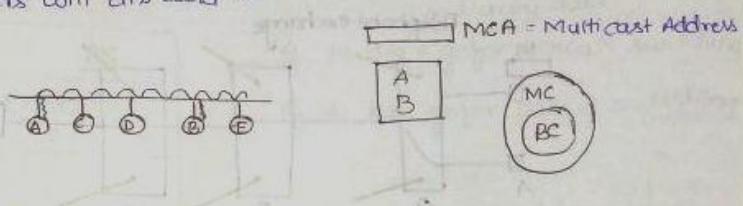

2. MULTICAST MAC ADDRESS: [1st Byte's LSB is 1]

3. BROADCAST MAC ADDRESS: [All the bits are ones in MAC Address] FF:FF:FF:FF:FF:FF

⇒ The multicasting MAC Address is implemented in this way

(24)

⇒ Consider a LAN containing many stations. Now, I want to send a message to two stations A and B (or) Repeatedly I want to send messages to some set of stations inside my LAN. Let us assume that A, B are my stations and if I send a message both of them should receive it. Then it is always better that you create a group for them and for that group you are giving a Group ID and that ID should be a multi cast Address, and inform A and B that see you both are present in a Multicast Group with some Address then Both A/B will configure their NIC's in such a way that whenever any packet is sent to that particular Multicast Address both of them will automatically Read and others will disregard it.

LENGTH : 2 Bytes = 16 bits

: The main reason for including Length field is ETHERNET follows variable length frames

: In CSMA/CD : $L \geq 2 \cdot T_p \cdot B_w$ substituting the standard values of T_p, B_w
 $L \geq 64$ Bytes for Ethernet we get

: Max Length : 1500 Bytes

	MIN	MAX
DATA	46B	1500B
FRAME	64B	1518B

DISADVANTAGES

- ⇒ Not applicable to Real-time Applications like in ATM Machine
⇒ Not applicable to Interactive Applications [chatting].
⇒ No priorities so not suitable for Client Server Applications.

$$\therefore \text{PREAMBLE} = 7B \quad \text{LENGTH} = 2B$$

$$SF_B = 1B$$

$$CRC = 4B$$

$$SA = DA = 6B$$

Q.6) min.
St 1: In the IEEE 802.3 frame, the minimum payload are of 46 bytes ✓
St 2: In IEEE 802.3 the error control mechanism is provided by CRC but not by checksum ✓
St 3: The minimum frame size IEEE 802.3 format is of 64 bytes including preamble. ✓

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29 are true.

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30 are true.

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 are true.

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32 are true.

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33 are true.

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34 are true.

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35 are true.

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36 are true.

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37 are true.

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38 are true.

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39 are true.

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40 are true.

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41 are true.

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42 are true.

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43 are true.

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44 are true.

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45 are true.

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46 are true.

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47 are true.

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48 are true.

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49 are true.

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50 are true.

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51 are true.

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52 are true.

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53 are true.

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54 are true.

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55 are true.

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56 are true.

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57 are true.

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58 are true.

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59 are true.

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60 are true.

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61 are true.

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62 are true.

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63 are true.

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64 are true.

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65 are true.

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66 are true.

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67 are true.

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68 are true.

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69 are true.

Only 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 3

3. ERROR CONTROL METHODS

I. ERROR CONTROL AND CRC

⇒ The main reason for packet loss is "congestion".

⇒ Error handling is mainly of 2 types → Error Detection → (D+D), parity check, Check
→ Error Correction → Hamming code {

CRC,
checksum

CRC (CYCLIC REDUNDANCY CHECK)

⇒ CRC is mainly used at Hardware Level

Bender CRCG Receiver
 1011011 1101 Appended Bits
 Appended Data = 1011011 000

→ If CRC Generator is m bits we
are going to append $(m-1)$ bits(All 0s)
to the data.

$\Rightarrow \oplus = \text{Exclusive OR} @\rightarrow \bmod 2 \text{ sum}$

$$\begin{array}{l} 1 \oplus 1 = 0 \\ 0 \oplus 0 = 0 \end{array}$$

Nano

1101) 1011011000 (... \Rightarrow If $CRC\ G = n$ bits then $CRC = \frac{m}{n}$
 1101
 0110 011000
 1101
 0001 11000
 1101
 0011 00
 1101
 0001
 Now the least significant 3 bits will be the "CRC".

⇒ Already start Applying xor from the leading 1 (Starting 1)

Now the least significant 3 bits will be the "CRC" = 001.

∴ The zeros that you appended at the beginning will be replaced by CRC and gets transmitted.

∴ The data that will be sent to Receiver is = Actual data + CR

$$= \underline{1011011001} \quad \text{CRC}$$

At Receiver side, whether the data that is transmitted is Right or wrong

$$\begin{array}{r} 1101)1011011001(\\ \underline{1101} \\ 0110011001 \\ \underline{1101} \\ 000111001 \\ \underline{1101} \\ 000101 \\ \underline{1101} \\ 0000 \\ \text{CRC} \end{array}$$

If you get all zeros as CRC
then the data that is transferred
is error free

2. CRC EXAMPLE

$$\text{CRC: } x^3 + x + 1 = 1 \cdot x^3 + 0 \cdot x^2 + 1 \cdot x + 1 \cdot x^0 = 1011 \text{ is the CRC}$$

If the degree of the polynomial = 3 the no. of bits in CRC Generator are 4
and we append '3' bits \therefore Degree of the CRC polynomial = Size of CRC generated.

At Sender

Data: 11010

$$\text{CRC: } x^3 + x + 1 = 1011$$

\therefore Appended data = 11010 000

RAM: 102 - 112

At Receiver Side

$$\begin{array}{r} 1011)11010000(\\ \underline{1011} \\ 01100000 \\ \underline{1011} \\ 0111000 \\ \underline{1011} \\ 010100 \\ \underline{1011} \\ 00010 \\ \text{CRC: } 010 \end{array}$$

$$\begin{array}{r} 1011)11010010(\\ \underline{1011} \\ 01100010 \\ \underline{1011} \\ 0111010 \\ \underline{1011} \\ 010110 \\ \underline{1011} \\ 00000 \\ \text{CRC: } 000 \end{array}$$

= All 0's ✓

3. CHECKSUM

\Rightarrow TCP, IP, UDP uses 16 bit checksum, and checksum is used at Software level.

\Rightarrow The entire stream of data (bits) are divided into many parts of equal sizes which is equal to the size of checksum that you need i.e. If you are using 8 bit checksum then divide the entire stream of data into equal parts and size of each part should be 8.

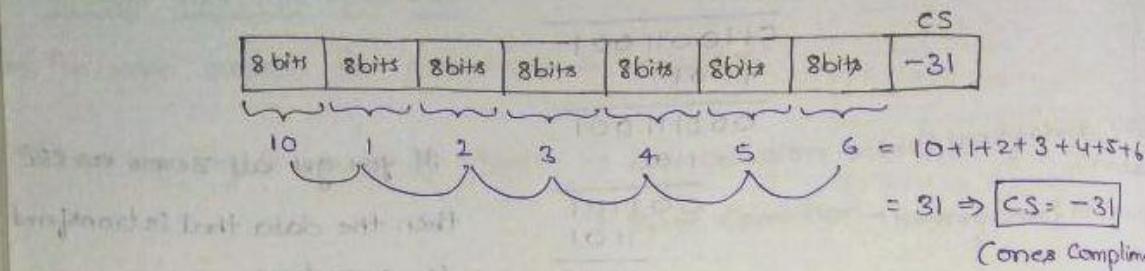

If we have to send 7 bits of data then the number of redundant bits need to be added before send the data is _____

Solution:
We need to satisfy the condition $2^r = m + r + 1$ where r is number of redundant bits and m is number of data bits that needs to be sent.
The smallest value for $r = 4$ is satisfying the condition.
Hence the answer is 4.

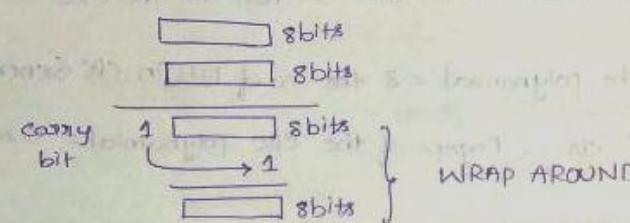

Correct Option
Your Answer is 1

→ Now encode the decimal values of all the points and add them all, finally than ans you get must be Negotiated (if we get 34 you should write -34) and add this value (-34) to the checksum field.

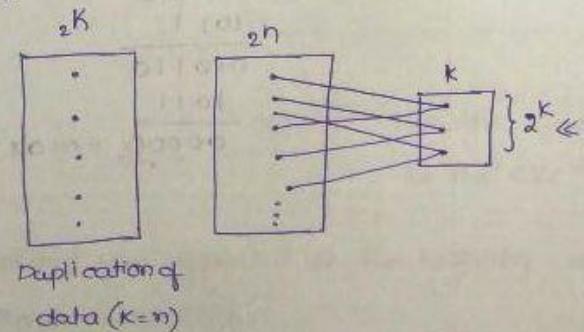

→ suppose if i add two 8 bit nos in the above checksum then i may get a 9 digit Binary number then you take the LSB and add it to the obtained number, This is called "Wrap Around".

4. CN - SUMMARY

- ⇒ No method is actually Reliable, the data may be corrupted (or) the Error handling bits may be corrupted.
- ⇒ Meaningful errors are nothing but, data is being corrupted in such a way that no one is able to detect it because error handling bits are also changed.

Q.31 Which of the following are true?

(1) A CRC of length K is calculated over a message of length M bits. The CRC will detect all errors in the message.
(2) The strings 10001 and 11001 have a Hamming distance of one.
(3) If a single parity bit is added to a message, the resulting code set has a minimum Hamming distance of two.
(4) A larger Hamming distance is needed to detect errors than to correct errors.

Solution: (ii)
Ans: ii
Explanation: 1. Detects only single and double bit errors.
2. Yes, only one bit change in hamming distance is only.
3. True, To detect it requires the minimum Hamming distance needed is 3.
Single parity codes can detect all single-bit errors.
In hamming distance will be for d=1.
4. To detect errors d=1 code and to correct errors 2d+1 code

Time taken to answer this question (00:01:21 sec)

Help Answer **Give Hint** **Give Hints** **Give Complain**

All are true

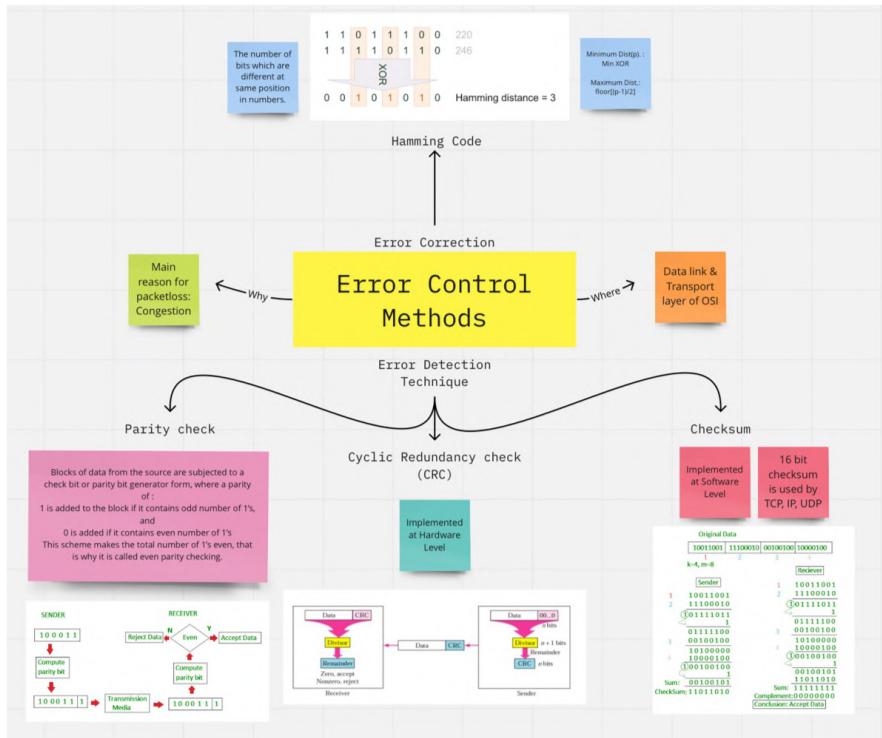

2 and 4 are true

3 and 4 are true

Correct Option

Your answer is Wrong

Error Control Questions from GATE

02. Consider the following message $M = 1010001101$.
 The cyclic redundancy check (CRC) for this message
 using the divisor polynomial $x^4 + x^3 + x^2 + 1$ is
(GATE-05)

(a) 01110	(b) 01011
(c) 10101	(d) 10110

02. Ans: (a)

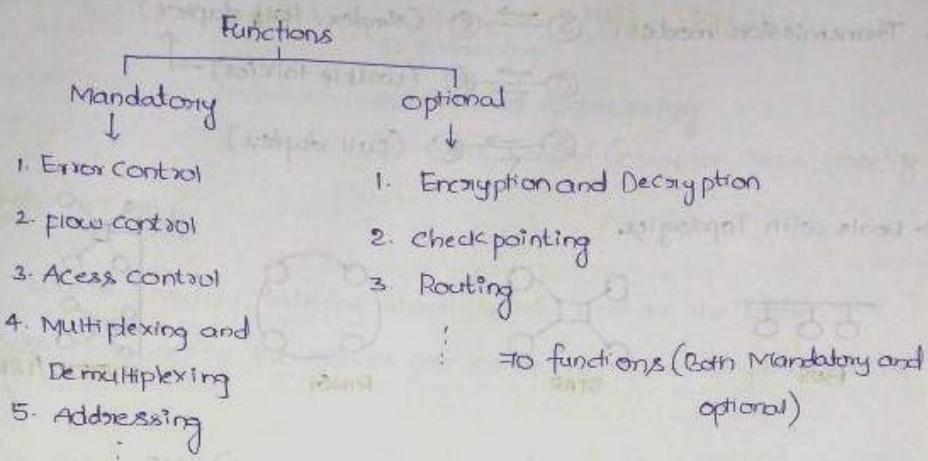

03. An error correcting code has the following code words:
 00000000, 00001111, 01010101, 10101010
 11110000.
 What is the maximum number of bit errors that can be corrected ? **(GATE-07)**

Q3. Ans: (b)
Sol:
 Code word 1 Code word 2 Code word 3 Codeword 4
 00000000 00011111 01101011 10101010
 To calculate Hamming distance between two code words, perform bitwise XOR operation between them.
 Code word 1 \oplus Code word 2 Code word 1 \oplus Code word 3 Code word 1 \oplus Code word 4
 Code word 1 \oplus Code word 2 Code word 1 \oplus Code word 3 Code word 1 \oplus Code word 4
 Code word 1 \oplus Code word 4 Code word 2 \oplus Code word 3 Code word 2 \oplus Code word 4
 Minimum Hamming Distance between all code words = 4.
 Maximum number of bit errors that can be corrected
 $= \left\lceil \frac{(d-1)}{2} \right\rceil = 1$

4. ISO/OSI STACK

(19)

1. ISO - OSI LAYERS

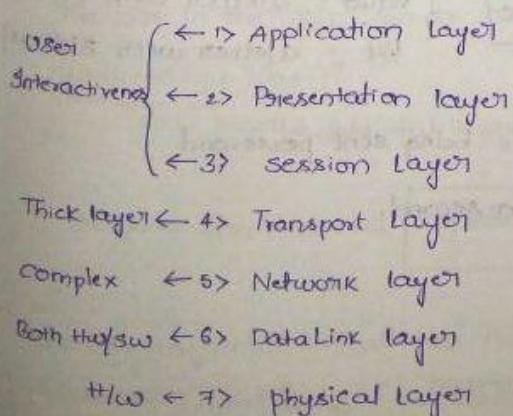

⇒ To implement all the above functionalities there are various Reference models which classify all the above functionalities and define what functions are carried out at a particular layer. One of the Reference model is "ISO-OSI STACK".

- 1> ISO-OSI
- 2> TCP/IP
- 3> ATM
- 4> X.25
- 5> IEEE (Mainly deals with LAN Technologies)

Various Reference models

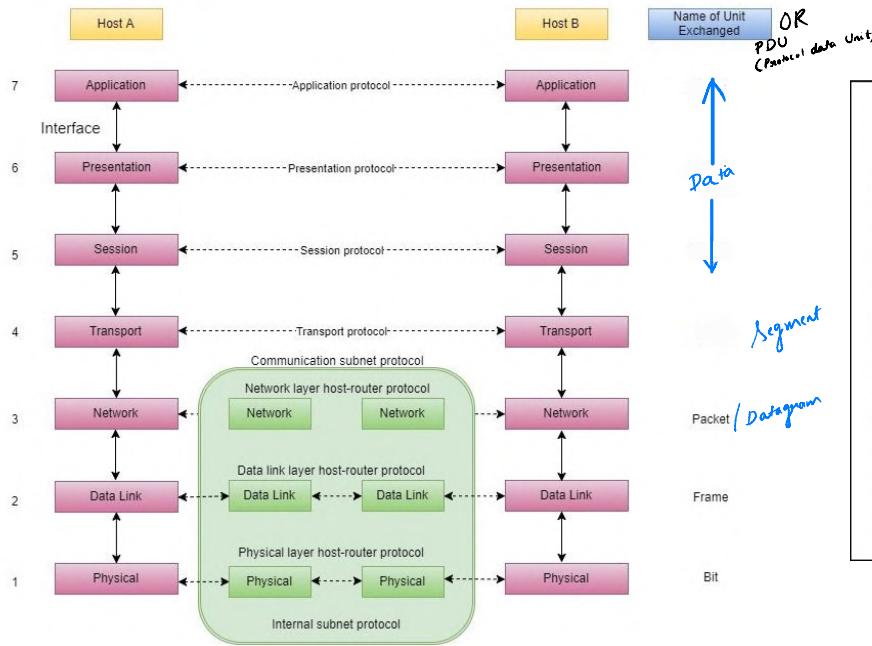

⇒ ISO-OSI stands for "International Standard Organisation - open system interconnection".

⇒ The various layers in the OSI model are:

- 1> 1 Advantage of Layering is
- 1. Divide and conquer
 - 2. Encapsulation is possible.
 - 3. Abstraction.
 - 4. Testing is made easy

{Google out: RFC (Request for comments) for learning CN}

OSI Layer	Purpose
<i>Application</i>	Application Program
<i>Presentation</i>	Data Interpretation
<i>Session</i>	Remote Actions
<i>Transport</i>	End-to-End Reliability
<i>Network</i>	Destination Addressing
<i>Data Link</i>	Media Access & Framing
<i>Physical</i>	Electrical Interconnect

OSI (Open Source Interconnection) 7 Layer Model					
Layer	Application/Example		Central Device/Protocols	DOD4 Model	
Application (7) Serves as the window for users and application processes to access the network services.	End User layer Program that opens what was sent or creates what is to be sent Resource sharing • Remote file access • Remote printer access • Directory services • Network management		User Applications SMTP		
Presentation (6) Formats the data to be presented to the Application layer. It can be viewed as the "Translator" for the network.	Syntax layer encrypt & decrypt (if needed) Character code translation • Data conversion • Data compression • Data encryption • Character Set Translation		JPEG/ASCII EBDIC/TIFF/GIF PICT		Process
Session (5) Allows session establishment between processes running on different stations	Synch & send to ports (logical ports) Session establishment, maintenance and termination • Session support - perform security, name recognition, logging, etc		Logical Ports RPC/SQL/NFS NetBIOS names		GATEWAY
Transport (4) Ensures that messages are delivered error-free, in sequence, and with no losses or duplications.	TCP Host to Host, Flow Control Message segmentation • Message acknowledgement • Message traffic control • Session multiplexing	PACKETIZING	TCP/SPX/UDP		Host to Host
Network (3) Controls the operations of the subnet, deciding which physical path the data takes.	Packets ("letter", contains IP address) Routing • Subnet traffic control • Frame fragmentation • Logical/physical address mapping • Subnet usage accounting		Routers IP/IPX/ICMP		Internet
Data Link (2) Provides error-free transfer of data frames from one node to another over the Physical layer.	Frames ("envelopes", contains MAC address) [NIC card → Switch → NIC card] [send to end] Establishes & terminates the logical link between nodes • Frame traffic control • Frame sequencing • Frame acknowledgement • Frame delimiting • Frame error checking • Media access control		Switch Bridge WAP PPP/SLIP	Can be used on all layers	
Physical (1) Concerned with the transmission and reception of the unstructured raw bit stream over the physical medium.	Physical structure Cables, hubs, etc. Data Encoding • Physical connection attachment • Transmission media • Baseband or Broadband • Physical medium transmission Bits & Vols		Hub Land Based Layers		Network

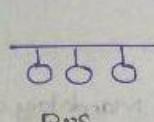

2. PHYSICAL LAYER

⇒ physical layer deals with Electrical, Mechanical, Functional, procedural characteristics of physical links.

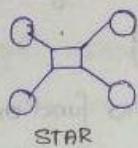

- ⇒ Transmission modes:
- $S \rightarrow R$ (simplex / half duplex)
 - $S \leftrightarrow R$ (walkie talkies)
 - $S \leftarrow R$ (full duplex)

No. of duplex/simplex link is independent of Topologies

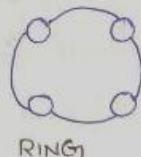

⇒ Deals with Topologies.

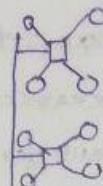

BUS

STAR

RING

HYBRID/TREE

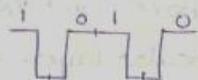

MESH

⇒ Deals with Encoding (Bits → Signals, waves) 1010

MANCHESTER ENCODING

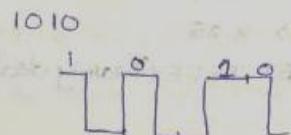

1 - Represented by ↗

0 - Represented by ↘

DIFFERENTIAL MANCHESTER ENCODING

0 - Represented by ↘, ↗

1 - Represented by ↗, ↘

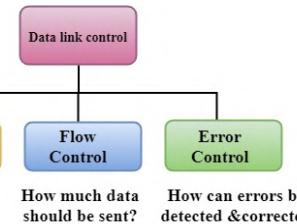

In both the Encodings (Manchester and Differential manchester)

$$\text{Baud Rate} = 2 * \text{Bit rate}$$

{ Baud = a letter with 4 letters
Bit = a letter with 3 letters }

Baud Rate = No. of voltages that are being sent per second

Bit Rate = No. of Bits that are sent per second.

3. INTRODUCTION TO DATA LINK LAYER

The main functions of DLL are \Rightarrow Flow control (SAW, GBN, SR)

\Rightarrow Error control (CRC, checksum)
 ↓
 DLL TCP/IP

\Rightarrow Framing

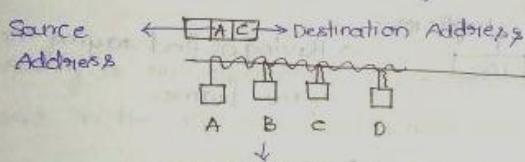

\Rightarrow physical Addressing

\Rightarrow Access control (CSMA/CD, Token passing...)

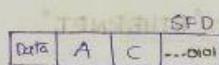

4. FRAMING AT DLL

\Rightarrow At DLL we are mainly talking about LANs and all the LANs are multi-access channels (All the stations are connected to a single Broadcast medium)

\Rightarrow Framing is nothing but taking the data from the above layer (NL) and putting it in a frame and sending it

\Rightarrow The starting of the packet is seen by B and it will discard it as the destination Address is 'C', so every station should know that a frame is Beginning so it has a special field called "SFD" (Starting Frame Delimiter)

\Rightarrow Now, SFD Represents that the frame is coming and Alerts all the stations, generally "SFD" is a sequence of bits that is entirely different from the data.

The bits in the "SFD" can be represented with the help of Regular Expression

$(0101010\dots11)(0+1)^*$

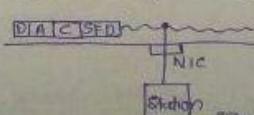

SFD The data that is present

Now we can convert

Regular Expression \rightarrow DFA \rightarrow Sequential Circuit
 (Built using flip-flops)

Now, this sequential circuit has the capability of Recognising the Bits/RE

i.e. $(0101010\dots11)(0+1)^*$ so,

At this point the Sequential

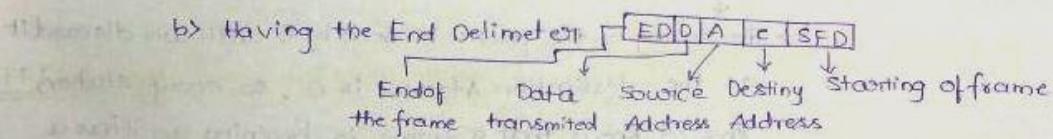

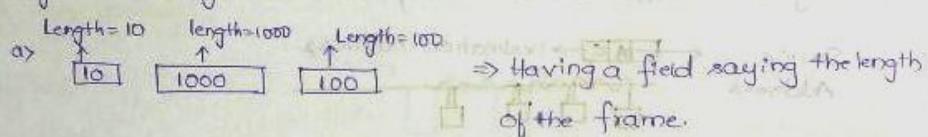

circuit alerts the station and says that see a frame is going, if it is true.

- It is not just enough that you identify the start of the frame(s).
it is important to find where the frame ends.
- Traditionally framing has been divided into two types
 - Fixed Length
 - Variable Length
- The disadvantage of Fixed Length framing is It has Internal Fragmentation.

Ex: $L = 1000\text{Bytes}$ ⇒ The min and max amount of data that can be sent is 1000 Bytes, if I have to send 100B then ??
 100B + 900 Bytes
 Dummy bits
 Added [This procedure is called padding].

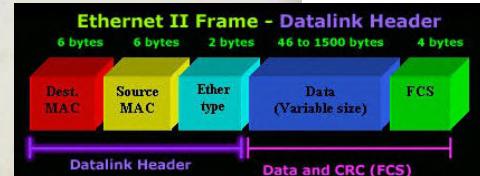

⇒ To identify the ending of frame there are two methods they are,

1. Having a field saying the Length of the frame
2. Having an Ending Delimiter

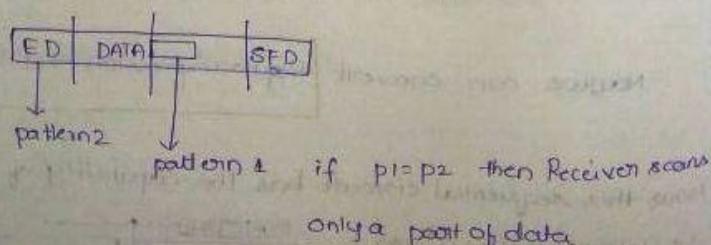

⇒ Fixed Length frames are used in "ETHERNET."

⇒ Variable Length frames are used in "TOKEN RING."

⇒ The problem with having the length field is, if it gets corrupted then Receiver reads only the data upto the modified value of length field.

⇒ The problem with End delimiter is if ED pattern matches with Data(part)
 then the receiver cannot scan the entire data available

Consider a character stuffing problem where FLAG is used as delimiter, and an ESC character is inserted whenever a character matches the delimiter.

The following data fragment occurs in the middle of a data stream for which the byte stuffing algorithm described in the text is used: A ESC C ESC FLAG D. What is the output after stuffing?

ESC Flag

ESC

ESC A **ESC** C **ESC** ESC **ESC** ESC **ESC** FLAG **D**

ESC A **ESC** C **ESC** ESC **ESC** FLAG **D**

ESC A **ESC** C **ESC** ESC **ESC** FLAG **D**

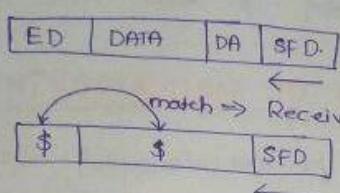

Solution: (1) **ESC**
ESC A, if you want to consider **ESC** as a data then you have to put **ESC** before **FLAG**. If you want to consider **ESC** as a del then you have to put **ESC** before **ESC**. Only option of correctly stuffing this is A **ESC** C **ESC** ESC **ESC** FLAG **D**.

Your answer is Wrong

Correct Option

⇒ End Delimiter can be dealt in 2 ways they are : character stuffing
Bit stuffing.

CHARACTER STUFFING

OBsolete Technology

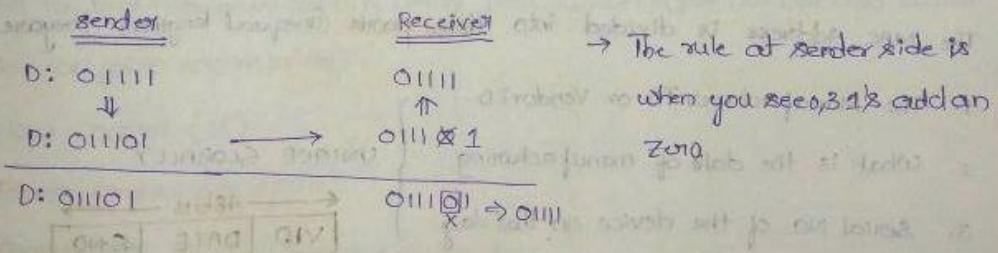

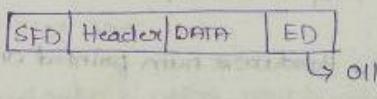

⇒ so, add a null character after \$ so that the Receiver thinks / sees a '0' followed by a '\$' then it assumes it is not the end of data and it discard the Null character and scans the entire data.

ED	\$10	SFD
----	------	-----

Now, if ED = \$10 and the data is \$10 then there is problem so add again null character \$1010 to the data. ⇒ \$10 \$1010 SFD

⇒ So Adding a Null character for each and every match with the character present in the ED is called "character stuffing".

BIT STUFFING (Very Imp for GATE)

If ED = 01111

Sender side

D: 011110
SD: 0111100 (After four ones add a zero) SD: 0111101

Receiver side

D: 0111100
01110

SD: Stuffed Data

∴ ED = 01111

D = 0111 000 1110

Now, what is the data after Bit stuffing?

So Data = 0111 000 1110

Stuffed Data = 0111 0 000 111010

∴ ED = 0111111

Data → At the sender after the Run of 6 ones im going to add 0110

= 011111101

→ At the Receiver side after a '0' followed by '6' ones im going to delete a zero.

4. PHYSICAL ADDRESSING

There are two types of Addresses

physical address - static, constant
Logical Address.

→ Now physical Address should be unique within the Network

→ Logical Address should be unique in the entire World wide web.

→ IP Address = 32bit Number, software num.

→ MAC Address = 48bit Number, hardware num pointed on our "NIC" → ROM → MAC

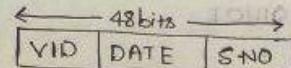

The MAC Address is divided into three parts (inequal lengths) they are

1. The Manufacturer ID or VendorID

2. What is the date of manufacturing

3. Serial No. of the device on that day

UNIQUE GLOBALLY

→ Conceptually Both IP, MAC Addresses can be logical but only IP Address is used for Logical Address because the info in the IP Address (NID/HID) are sufficient for Routing the packets, whereas this is not the case in MAC Addressing.

→ MAC is a physical Address.

TALK
⇒ "APPLE INC" is the NW in the world that does not use the MAC Address it artificially generates a random Number and assigns to the users.

⇒ Data Link Layer is divided into two parts they are : 1) Logical Link Control

2) Medium Access Control

⇒ LLC takes care of Error control, flow control,

⇒ MAC takes care of framing, access control, Error control, physical Address

L-6: INTRODUCTION TO NETWORK LAYER

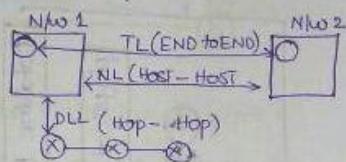

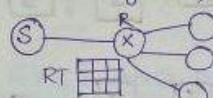

The main Responsibilities of Network layers is

1) Host to Host connectivity

2) Logical Addressing

3) Switching (Connecting various Networks together)

4) Routing

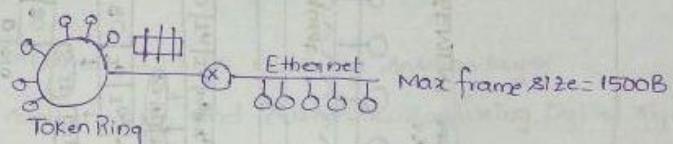

⇒ Building the Routing table = Routing

⇒ Using the Routing table = switching

5) Congestion Control

6) Fragmentation.

7. TRANSPORT LAYER

The main Responsibilities are

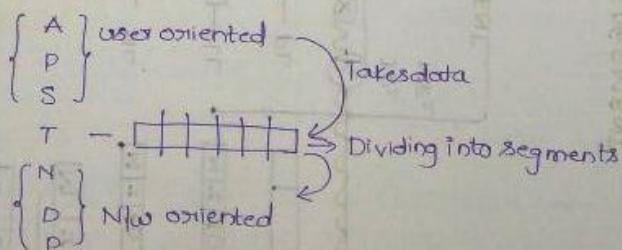

1) End to End communication using port numbers (port no's are also called Service point Addressing):

2) Flow control (SR)

3) Error control (checksum)

4) Segmentation

5) Multiplexing and Demultiplexing.

6) Congestion control

Refer
video
for
Detail
Explanation

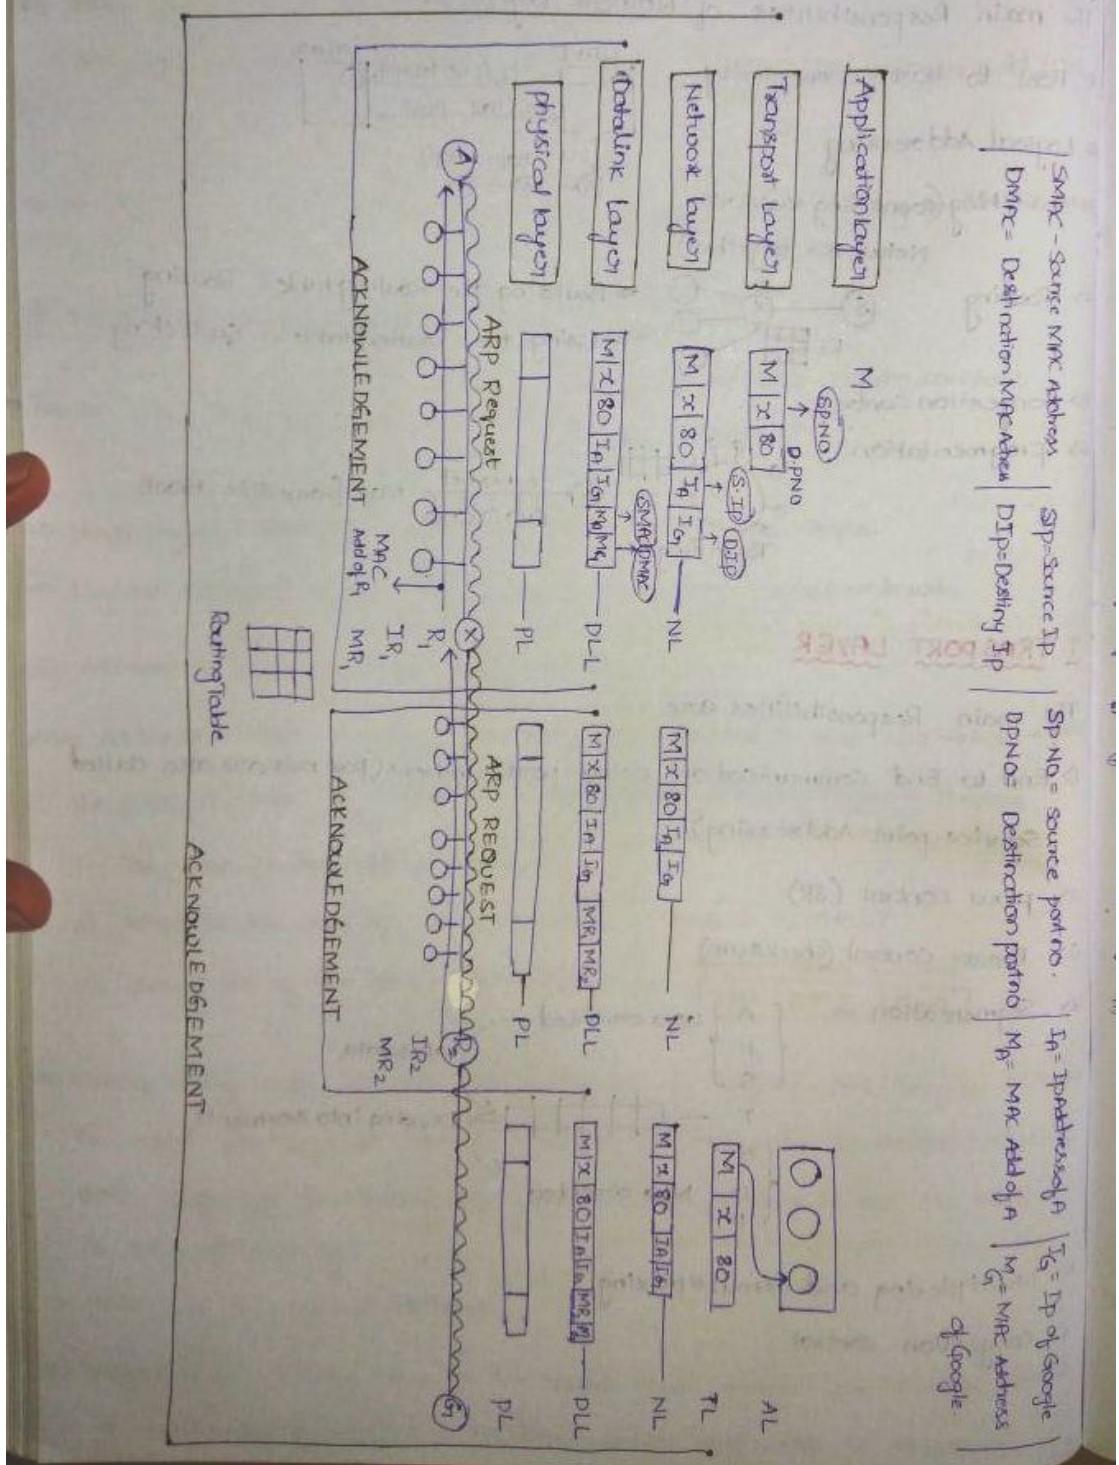

8. HOW ALL THE LAYERS WORK TOGETHER

⇒ The protocol used to convert IP Address to MAC Address is 'ARP'.

⇒ Router will have only three layers (NL, DLL, PL)

⇒ In general, the physical layer and Datalink layer are present on NIC, and Network layer is present in the operating system.

⇒ In IP there are no Acknowledgements. (connectionless datagram service)

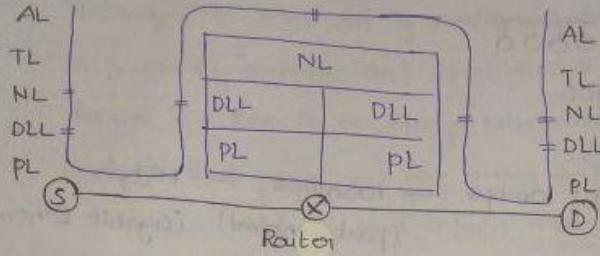

Imp points for Gate

(23)

⇒ Router have only 3 layers 1.PL 2.DL 3.NL

(2018-19) TENTH

- The no of times a packet hit the DataLink layer = 4
- The no of times a packet hit the Network layer = 3.
- Depending on No. of Routers we have the no of time each layer hits depend.

9. SESSION LAYER AND PRESENTATION LAYER

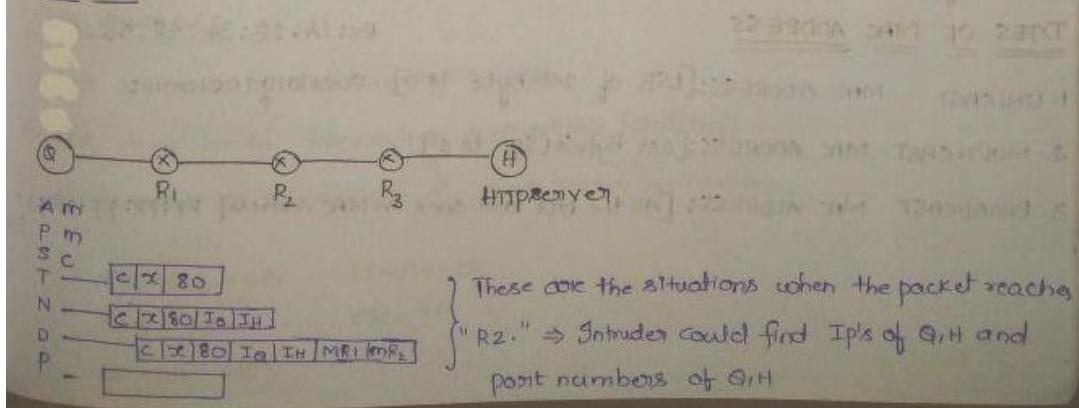

SESSION LAYER

- 1) passwords and usernames will be dealt by session layer
- 2) Main Responsibility Authorization and Authentication (using Digital signatures)
- 3) check pointing (Torrentz example).
- 4) Synchronization.
- 5) Dialog control
- 6) Logical Grouping of operations

Presentation Layer

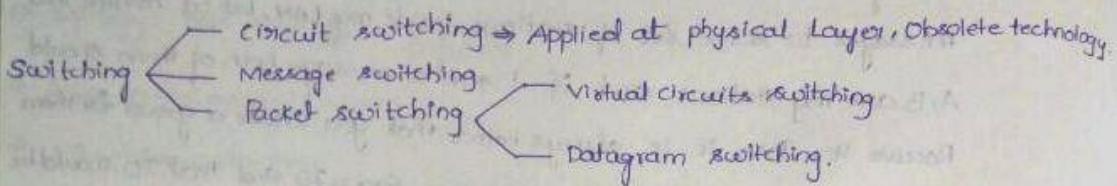

- 1) character translation
- 2) Encryption and Decryption.
- 3) Compression (.Zip)

GATE - 2014

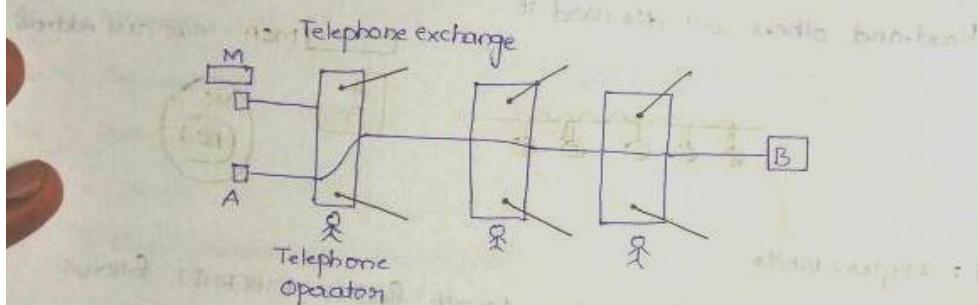

6. SWITCHING

1. INTRODUCTION TO SWITCHING

⇒ Switching is done at Network Layer

2. COMPARISON BETWEEN CIRCUIT SWITCHING AND PACKET SWITCHING

Let M = size of total message that 'A' wants to send to 'B'.

B = Bandwidth of the entire channel

X = No. of Hops

d = Length of Each hop

v = Velocity of signal

Total time taken to send

$$\text{message } m \text{ to } B \text{ is} = \text{Setup time (connection establish time)} + T_c + \frac{xd}{v}$$

$$= \text{Setup time} + \frac{M}{B} + \frac{xd}{v} + TD \quad \left\{ \begin{array}{l} T_p \text{ b/w two hops} = d/v \\ \text{In b/w } x \text{ hops} = x \cdot d/v \end{array} \right\}$$

\rightarrow Teardown the link

$$TT = \text{Setup time} + \frac{M}{B} + \frac{xd}{v} + TD$$

packetization is the process of dividing the data into packets and transmitting.

⇒ The packetization process helps in reducing the total transmission time and the size of the packet should not be too small if it is the case the total time taken to transmit the data will increase. So the packet size must be chosen appropriately.

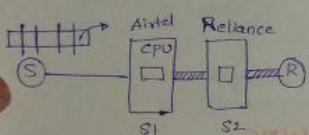

4. VIRTUAL CIRCUITS AND DATAGRAMS

There are two types of packet switching they are Virtual circuits, Datagram.

⇒ Our phone call is going through virtual circuit.

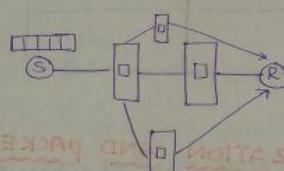

⇒ Our Data usage is going through Datagram circuit.

Virtual circuit

- 1> Headers are not required
- 2> for the 1st packet, Global Header
for other packets, local header
- 3> Connection oriented (Resource Reservation) if resources are reserved then it is connection oriented. (Buffer, CPU, BW)
- 4> Same path → Inside packets
- 5> Highly Reliable
- 6> Costly
- 7> ATM (Asynchronous Transfer mode)
Network uses ATM, VC.

Datagram Circuit

- 1> Headers are reqd for all packets
- 2> Connectionless oriented
- 3> No guarantee, they may follow diff path, they may appear out of order.
- 4> Not Reliable
- 5> Not very costly.
- 6> Voice, whatsapp call have VoIP (VOICE OVER INTERNET PROTOCOL).
- 7> IP Network uses Datagram.

Networking Devices

LAN Wires:

- 10BaseT(10 Mbps, No Mux, 100m)
- 10Base2(10 Mbps, No Mux, 200m); BASE stands for baseband signalling, & 2 for a maximum segment length approx 200 m
- 10Base5(10 Mbps, No Mux, 500m)
- 100Base(100 Mbps)
- All operations are physical layer
- Collision is possible

Repeater:

- A repeater operates at the physical layer.
- Its job is to regenerate the signal over the same network before the signal becomes too weak or corrupted so as to extend the length to which the signal can be transmitted over the same network. An important point to be noted about repeaters is that they do not amplify the signal. When the signal becomes weak, they copy the signal bit by bit and regenerate it at the original strength.
- It is a 2 port device and connects 2 same types of Network.

Hub:

- A hub is basically a multiport repeater. A hub connects multiple wires coming from different branches., eg: the connector in star topology which connects different stations.
- Hubs cannot filter data, so data packets are sent to all connected devices.
- They do not have the intelligence to find out the best path for data packets which leads to inefficiencies and wastage.

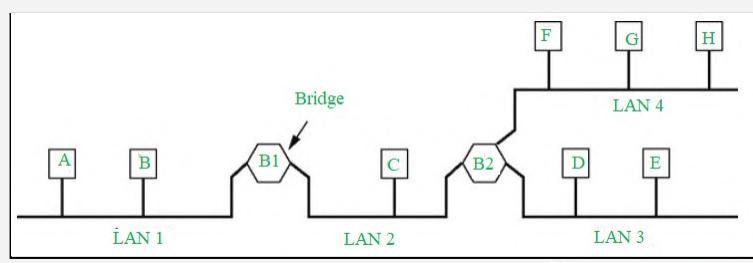

Traffic - ↑

Bridge:

- A bridge operates at the data link layer.
- A bridge is a repeater, which adds on the functionality of filtering content by reading the MAC addresses of source and destination.
- It is also used for interconnecting two LANs working on the same protocol. It has a single input and single output port, thus making it a 2 port device.
- Reduces Collision domain.
- Bridges uses Spanning tree Algorithms to avoid looping. As they can't use TTL at DLL.

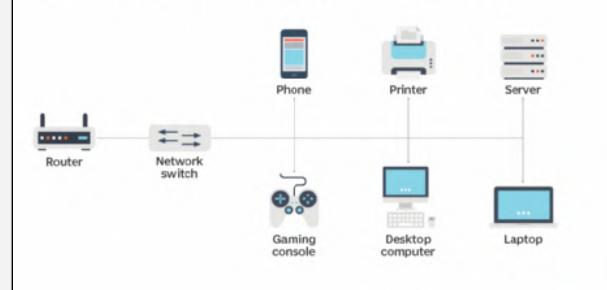

[GATE-2004]

Switch:

- A switch is a multiport bridge with a buffer and a design that can boost its efficiency(a large number of ports imply less traffic) and performance.
- A switch is a data link layer device.
- The switch can perform error checking before forwarding data, which makes it very efficient as it does not forward packets that have errors and forward good packets selectively to the correct port only. In other words, the switch divides the collision domain of hosts, but the broadcast domain remains the same.

How a network switch works

Routers:

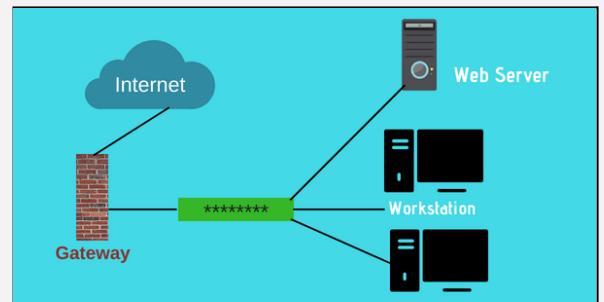

- The router is mainly a Network Layer device that connects two networks of the same type.
- A router is a device like a switch that routes data packets based on their IP addresses.
- Routers normally connect LANs and WANs together and have a dynamically updating routing table based on which they make decisions on routing the data packets. Routers divide broadcast domains of hosts connected through it.
- There are two types of routings
 - Router routing, where the router decides the outgoing route of the packet.
 - Source Routing, where sources can decide the route.

[GATE-2003]

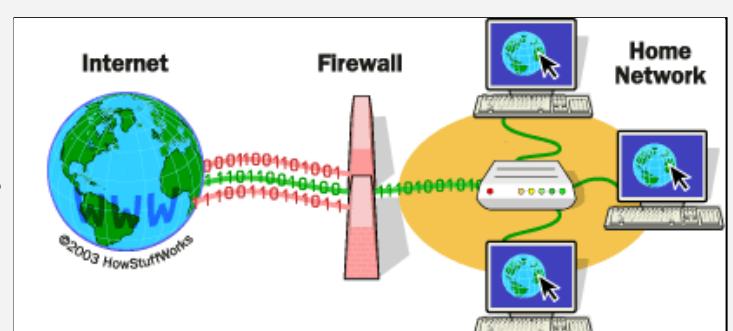

Gateway:

- A gateway is a passage to connect two networks together that may work upon different networking protocols. It basically works as the messenger agents that take data from one system, interpret it, and transfer it to another system.
- It works from Layers 1 through 7 of the OSI Model.
- Gateways are also called protocol converters and can operate at any network layer.
- Gateways are generally more complex than switches or routers.
- Proxy ✓
- Caching ✓
- NAT(Network address Translation) ✓
- Deep Packet Inspection ✓

Firewall

- A firewall is a network security device, either hardware or software-based, which monitors all incoming and outgoing traffic and based on a defined set of security rules it accepts, rejects or drops that specific traffic.
- Accept : allow the traffic
- Reject : block the traffic but reply with an “unreachable error”
- Drop : block the traffic with no reply
- A firewall establishes a barrier between secured internal networks and outside untrusted networks, such as the Internet.
- Layer 3 firewalls (i.e. packet filtering firewalls) filter traffic based solely on source/destination IP, port, and protocol.
- Layer 4 firewalls do the above, plus add the ability to track active network connections, and allow/deny traffic based on the state of those sessions (i.e. stateful packet inspection).
- Layer 7 firewalls (i.e. application gateways) can do all of the above, plus include the ability to intelligently inspect the contents of those network packets. For instance, a Layer 7 firewall could deny all HTTP POST requests from Chinese IP addresses. This level of granularity comes at a performance cost, though.

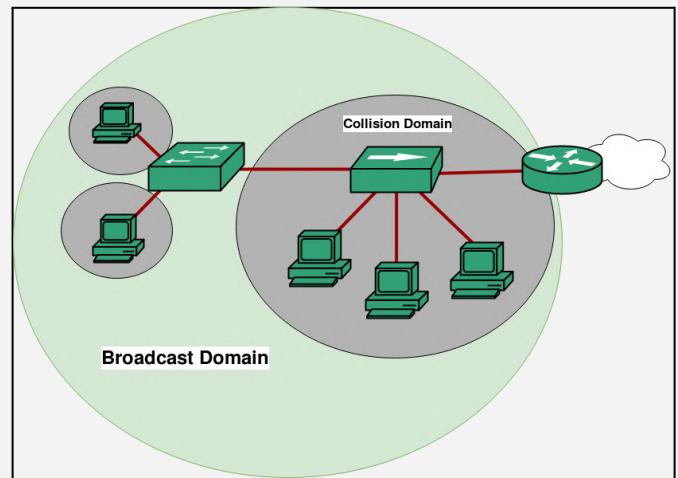

For Story of (Verizon, 2009) where the attacks came from inside the Firewall, read [Tanenbaum-CN : 8.6.2 Firewall](#)

Collision Domain

A Collision Domain is a scenario in which when a device sends out a message to the network, all other devices which are included in its collision domain have to pay attention to it, no matter if it was destined for them or not. This causes a problem because, in a situation where two devices send out their messages simultaneously, a collision will occur leading them to wait and re-transmit their respective messages, one at a time.

Remember, it happens only in case of a half-duplex mode.

Broadcast Domain

A Broadcast Domain is a scenario in which when a device sends out a broadcast message, all the devices present in its broadcast domain have to pay attention to it. This creates a lot of congestion in the network, commonly called LAN congestion, which affects the bandwidth of the users present in that network.

Networking Devices	Broadcast Domain	Collision Domain
Repeater	Same	Same
Hub	Same	Same
Bridge	Same	Reduces
Switch	Same	Reduces
Routers	Reduces	Reduces
Gateway	Reduces	Reduces

I. INTERNET PROTOCOL

1. INTRODUCTION TO IP HEADER

IPv4 Header

Version (4)	HL (4)	Type of service(8)	Total Length (16)	= 32 bits = 4 Bytes
Identification (16)	O D M	Fragment offset (13)	= 4 Bytes	
TTL (8)	Protocol (8)	Header checksum(16)	= 4 B	
		Source IP (32)	= 4 B	
		Destination IP(32)	= 4 B	
		Options (0-40) Bytes		
		Data		
				Max. Header length = 20 + 40 = 60B

HL:

Here the min size of the Header is 20B but the Header Length field HLF is of 4 bits \therefore only the numbers ranging from (0-15) can be represented so we use the process called scaled Arithmetic (divide by 4)

\therefore If Header Length = 20B \Rightarrow HLF contain (5)

$$\begin{array}{ccc} \text{HL} & & \text{HLF} \\ 20B & \longrightarrow & 5 \\ 32B & \longrightarrow & 8 \\ 40B & \longrightarrow & 10 \end{array}$$

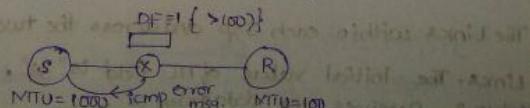

\Rightarrow In exam if a number is given, and if you want to identify it whether it is a Header Length or Header Length field the process is convert to decimal and check the ranges HLF (20B-60B) and HLF (5-15).

VERSION : The version of the Ip Address IPv4 / IPv6. If version = 0100 = IPv4 if version = 0110 \Rightarrow IPv6 \Rightarrow the packet must be parsed by the parsers appropriately.

2. IDENTIFICATION, MF, DF AND FRAGMENT OFFSET

\Rightarrow Identification number is used to number every datagram that is going out of a host. This field is mainly used when we do Fragmentation, when we do fragmentation all the fragments are going to get same identification number.

\Rightarrow DF: Don't fragment

Purpose of Running NAT(Network address translation)

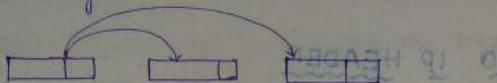

- # To connect to internet and your host don't have a global unique IP address.
- # if you change to a new ISP that requires you to re-number your network.
- # You require two intranets with duplicate addresses to merge

Fields in IP header for fragmentation -

- Identification (16 bits) - used to identify fragments of the same frame.
- Fragment offset (13 bits) - used to identify the sequence of fragments in the frame. It generally indicates a number of bytes preceding or ahead of the fragment.
- Maximum fragment offset possible = $(65535 - 20) = 65515$ (where 65535 is the maximum size of datagram and 20 is the minimum size of IP header).
- So, we have ceiling($65515 / 8$) = 13 bits for a fragment offset but the fragment offset field has only 13 bits. So, to represent efficiently we need to scale down the fragment offset field by $2^{12} / 2^{13}$ which acts as a scaling factor. Hence, all fragments except the last fragment should have data in multiples of 8 so that fragment offset is N.

⇒ Fragment offset is no. of data bytes ahead of this particular fragment

In this particular Datagram,

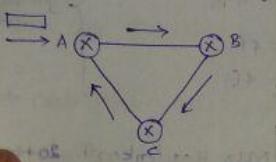

Ans: 26

3. TTL, PROTOCOL, HEADER CHECKSUM

TTL (8):

TTL is also used to count the number of routers between host and destination

consider the following scenario,

→ A, B, C are the routers and when a packet gets to router A then the router takes the IP address of the packet and tries to 'AND' with SM if it doesn't match it is going to send to default entry.

→ Let us say, Router A's default entry = Router B and Router B's default entry goes/leads the packet go to Router C and Router C's default entry = Router A. then the packet will fall in an infinite loop and will be entirely circulating and there may be some thousands of such packets, then as a result, the buffers are full, routers will be busy.

→ In order to overcome the above problem there is a concept called "TTL (TIME TO LIVE)" in which a packet is made to circulate only upto certain no. of hops after that many hops the packet will be discarded.

→ The main purpose of TTL is to discard the packet that falls in infinite loop.

→ THE TTL VALUE WILL BE DECREMENTED ONLY AT THE INTERMEDIATE

ROUTERS AND THE DESTINATION

GATE 14 paper 02

In the diagram shown below, L1 is an Ethernet LAN and L2 is a Token Ring LAN. An IP packet originates from 'S' and traverses to 'R', as shown.

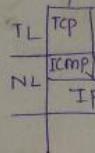

The links within each ISP and across the two ISP are all point-to-point optical links. The initial value of TTL field is "32". The max possible value of TTL when R receives the datagram is _____.

Q. 14

Consider a very large network of 5000 routers. Sender and receiver are connected with this network. Sender sends data to receiver and after some unit of time sender receives ICMP time exceeded message for the same transmitted packet. The maximum number of routers that can be travelled by packets when ICMP message reaches back to sender is _____

509	Correct Option
Solution: SM TTL uses 8-bit in IP header which can travel maximum of 255 routers. Total routers travelled = 255 (going forward) + 254 (time exceeded message coming back) = 509	
<input checked="" type="radio"/> NEW!

HEADER CHECKS

Q. 14

Which of the following statement is/are correct regarding IPv4 Datagram Header?

A The minimum value for HLLEN field is 5 and the maximum is 20.

Your answer is IN-CORRECT

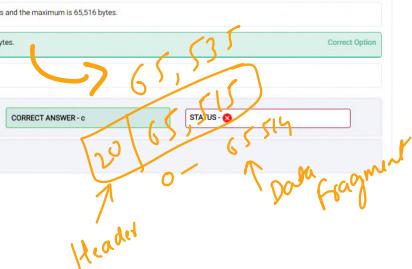

B Total Length field has a minimum value 20 bytes and the maximum is 65,516 bytes.

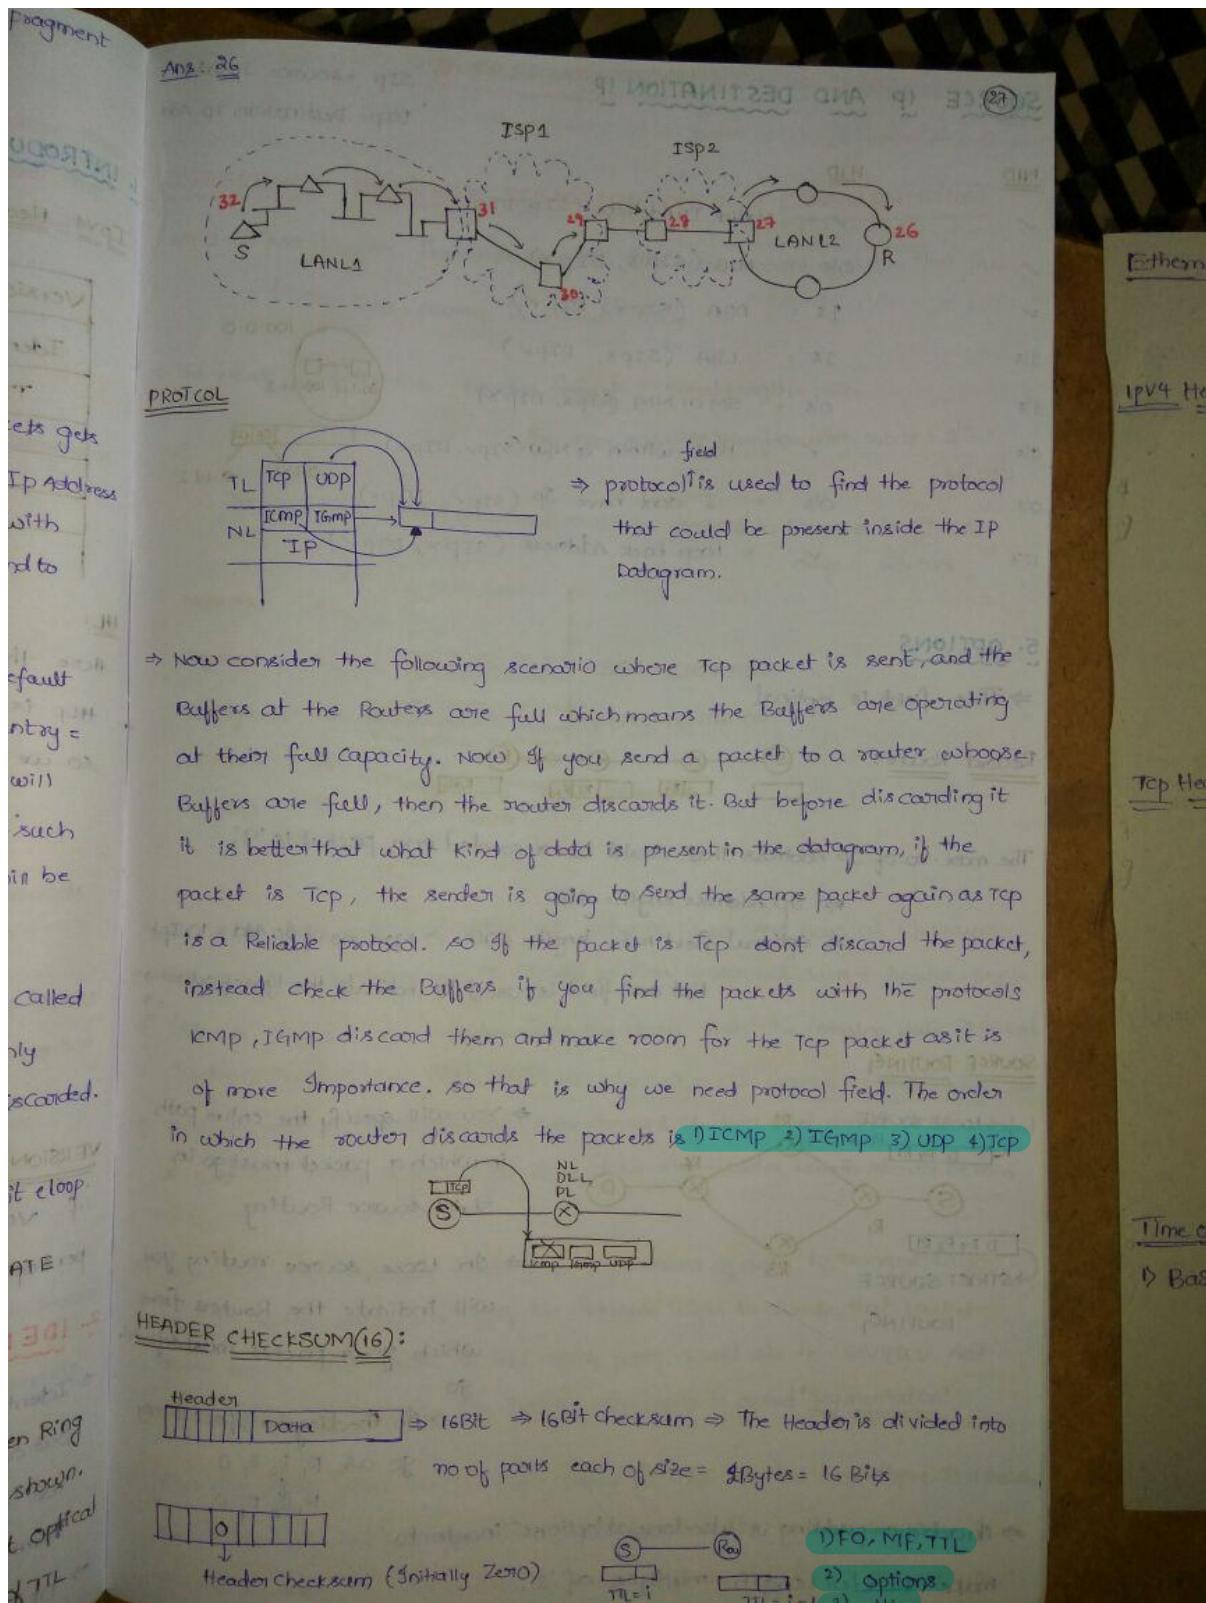

C Fragment Offset is maximum value of 65,514 bytes.

Correct Option

D None of these

YOUR ANSWER - a

SOURCE IP AND DESTINATION IP

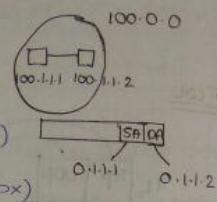

SIP = Source IP Add.

DIP = Destination IP Add.

NID

HID

- ✓ ✓ - Valid IP Address (SIP, DIP)
- ✓ 0's = NID (SIPx, DIPx)
- ✓ 1's = DBA (SIPx, DIPv)
- 1's 1's = LBA (SIPx, DIPv)
- 1's 0's = SM or NM (SIPx, DIPx)
- 0's ✓ = Host within a NW (SIPv, DIPv)
- 0's 0's = I don't have Sp (SIPv, DIPx)
- 127 ✓ = Loop back Address (SIPx, DIPv)

I. DIFFERENCE

MTU = Maximum frame size

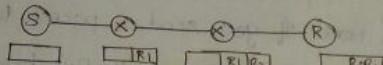

⇒ The next field

⇒ The max size

5. OPTIONS

⇒ This field is optional

Record Route:

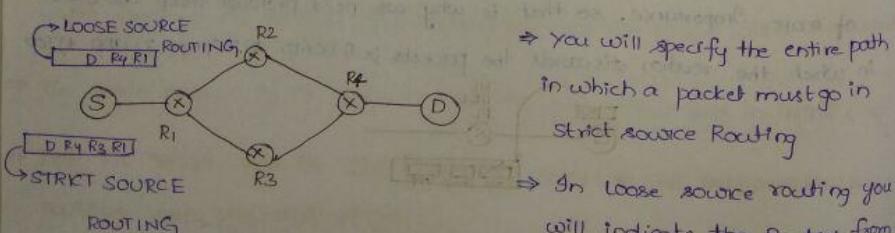

The max no. of Sp Address that could be recorded on a packet is 'q'.

⇒ Sp Address length = 4B

⇒ Optional field max length = 40B ⇒ Max no. of Sp Add = 10 IPs

But one field is used to indicate the type of options.

SOURCE ROUTING

⇒ You will specify the entire path in which a packet must go in Strict Source Routing

⇒ In loose source routing you will indicate the Router(s) from which your packet must definitely go

⇒ In the diagram, packet may go as R₁, R₂, R₄, D

R₁, R₂, R₃, R₄, D.

⇒ An addition padding is also done at 'options' in order to make Header Length multiple of '2'.

Sol: Record Route option in the IP header is used to record the path taken by the Echo Request message and corresponding Echo Reply message (available on IPv4 only). Each hop in the path uses an entry in the Record Route option. If possible, specify a Count that is equal to or greater than the number of hops between the source and destination. The Count must be a minimum of 1 and a maximum of 9.

The maximum number of addresses or names in the host list is 9

⇒ IP is a protocol
the max size of

⇒ If we remove
payload/Data payload

⇒ Here we are
at each and every
= 20B

⇒ Now Application
now it is the
given by all
the process of

⇒ Now the data
the problem is D
Ethernet then

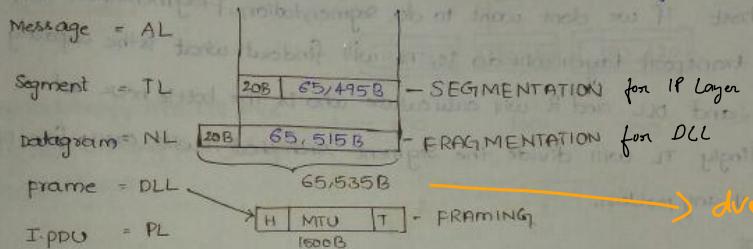

8. FRAGMENTATION

I. DIFFERENCE BETWEEN SEGMENTATION AND FRAGMENTATION

MTU = Maximum Transmittable Unit (The max amount of data that DLL frame can carry is called MTU)

⇒ The next field in the Header format = Total Length = 16b

- The max possible number with 16 bits = $2^{16} - 1$ = 65,535
- The max size of datagram that could be present in Ethernet in these days = 65,535

due to 16 bit only
in Identification

section of

IP Header

⇒ IP is a protocol that operates at Network layer. And now, at Nw layer the max size of datagram is 65,535 ⇒ Total amount of data + Header = 65,535

⇒ If we remove the Header from the data then the remaining data is called payload/datapoint at that layer.

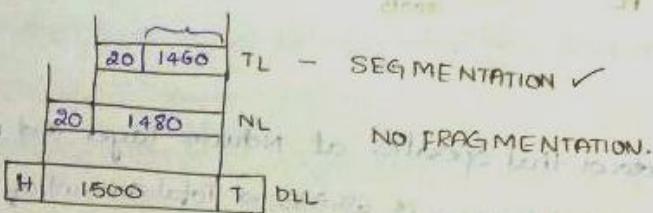

⇒ Here we are calculating the max amount of data that can be accommodated at each and every layer, to get max. data the Header Length should be min = 20B

⇒ Now Application Layer could give any amount of data to transport layer, now it is the responsibility of the Transport layer to divide that packet given by AL into parts so that each part could sit in 65,495B. And the process of dividing the packet into parts is called "Segmentation".

⇒ Now the data from the TL can easily fit into NL but here there is a problem, the problem is DLL has also some limitations, if the underlying LAN is Ethernet then the max size of data that can be fit is only 1500B.

which means NL is going to give you a data of 65,535 B, But DLL can hold a maximum of 1500 Bytes only. Now, NL should divide the datagram into parts so that each part could go and sit into 1500B and that process is called "FRAGMENTATION".

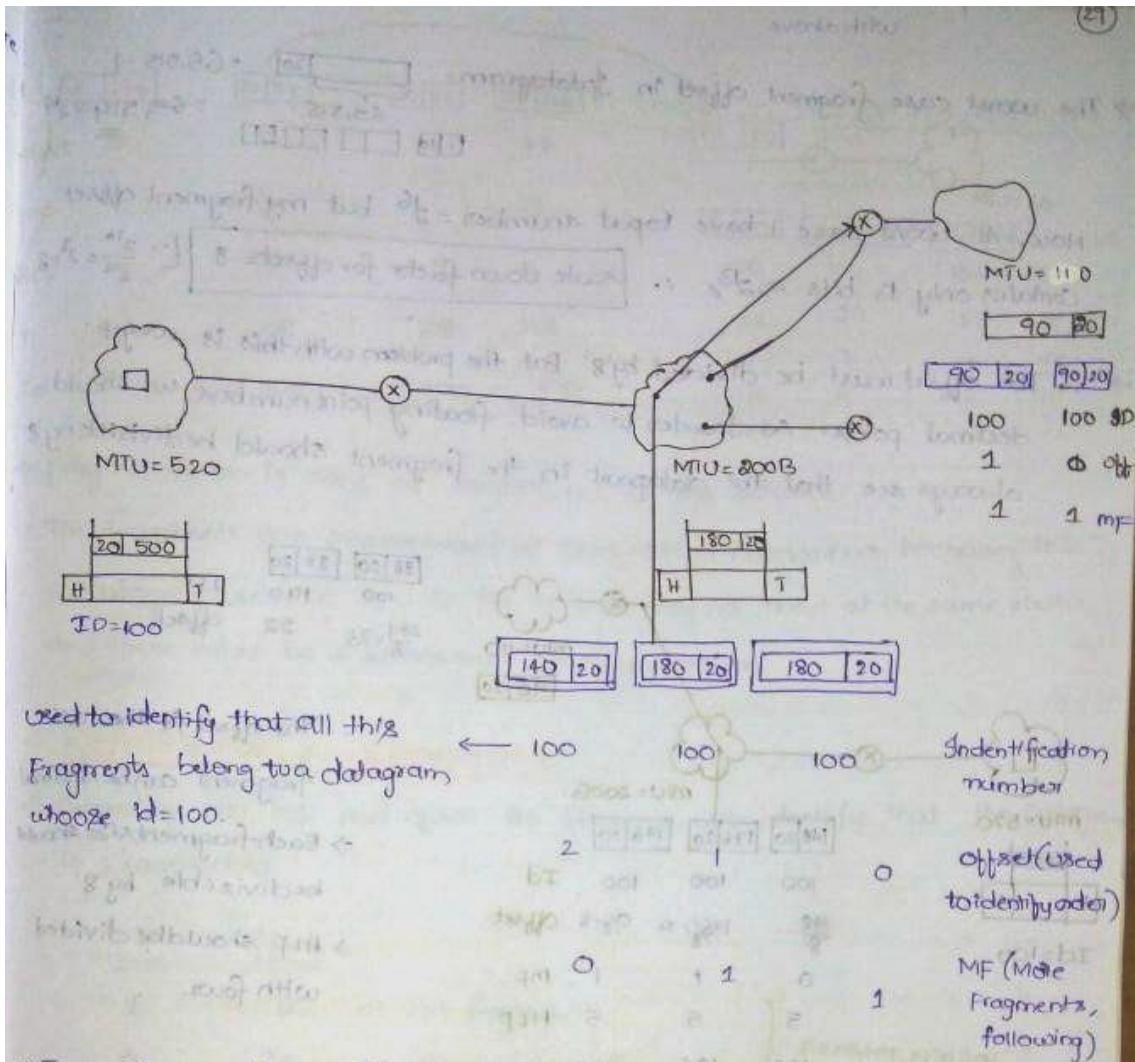

- ⇒ Now, once the Datagram is received by the DLL which is already fragmented, it will add Header and Tail along with preamble, SFD... and this process is called "FRAMING".
- ⇒ The problem here is either the Network Layer is going to be Bottleneck or DLL is going to be bottleneck, sometimes DLL can hold the data sent by NL without fragmentation, the bottleneck will be NL. So at the same host if we don't want to do segmentation, fragmentation then what transport layer will do is, TL will find out what is the capacity of NL and DLL and it will calculate who is the bottleneck and accordingly TL will divide the segment such that it will easily fit in DLL without any problem.

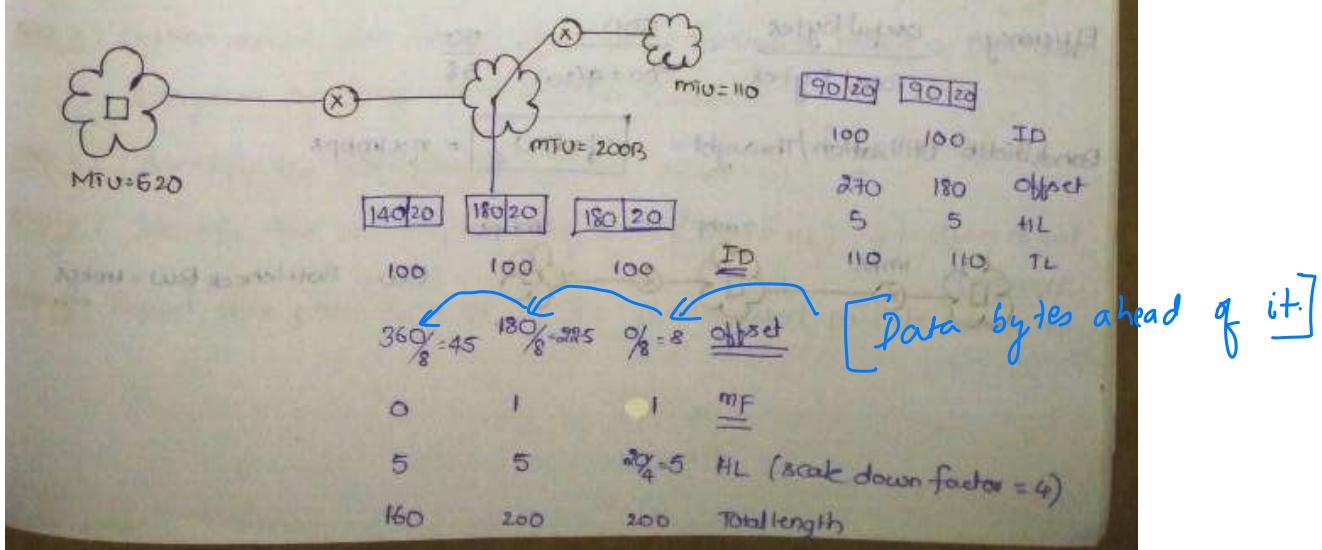

2. FRAGMENTATION EXPLAINED WITH NUMERICAL EXAMPLE

- ⇒ At source we do only segmentation in such a way that there is no need of fragmentation
- ⇒ MTU = Max amount of data that can sit in DLL frame

Fragm^{ent} Packet only not IP Header.

→ There is a problem with the above type of scenario, the offset is not actually scalable, so the offset is defined this way, offset is nothing but the no. of data bytes ahead of particular fragment. so the offset will be

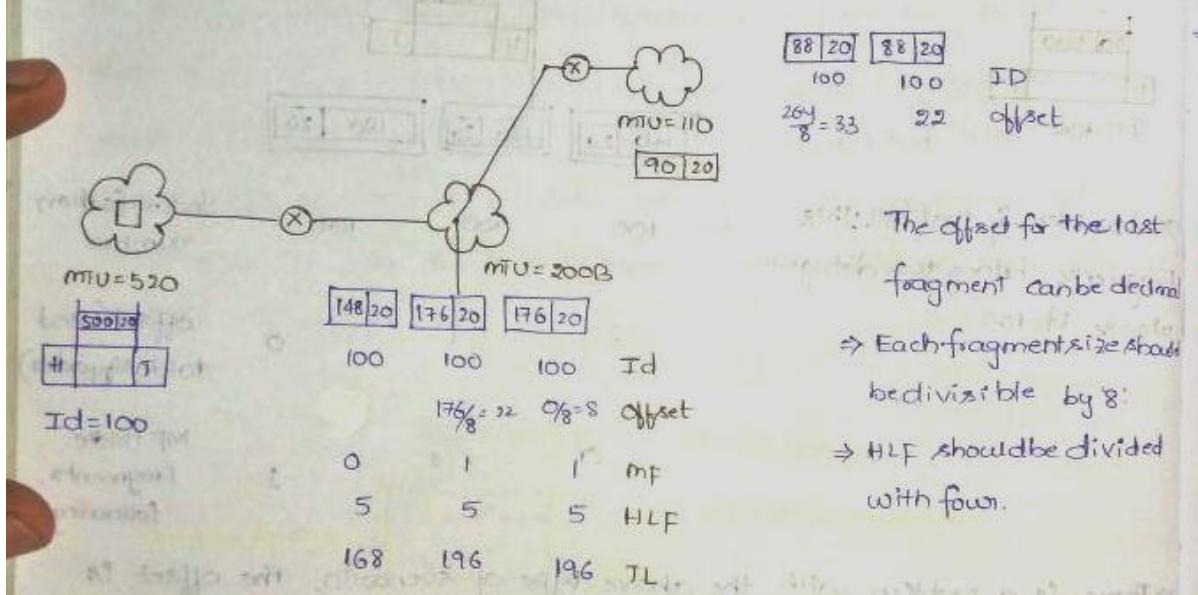

→ Now the problem scenario is, fragment offset = 13 bits \Rightarrow the max no in offset field = $2^{13}-1 \approx 8000$

→ The worst case fragment offset in Ipdatagram = $\frac{65,515}{120} = 545.125$
 $\frac{65,515}{120} = 545,514 \approx 545,515$

Now, At worst case I have to put a number = 2^{16} but my fragment offset contains only 13 bits $\Rightarrow 2^{13}$, \therefore [scale down factor for offset = 8] [$\because \frac{2^{16}}{2^{13}} = 2^3$]

∴ The offset must be divided by 8. But the problem with this is we get decimal points. So inorder to avoid floating point numbers we should always see that the datapart in the fragment should be divisible by 8.

The offset for the last fragment can be decimal

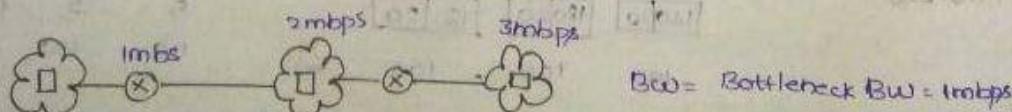

⇒ Each fragment size should be divisible by 8.

⇒ HLF should be divided with four.

Initial data = $(500B + 20B)$ → Split into 4 packets
 Total headers = $4 \times 20B$ → Initial header
 Final data = $500B + (4 \times 20B) \Rightarrow$ overhead = 3 headers $[4 \times 20 - 20] = [3 \times 20]$

Efficiency = $\frac{\text{Useful Bytes}}{\text{Total Bytes}} = \frac{500}{500 + 4(20)} = \frac{50}{58}$

Bandwidth utilization/throughput = $\eta \times \text{BW}$ = $\eta \times 1 \text{Mbps}$

BW = Bottleneck BW = 1Mbps

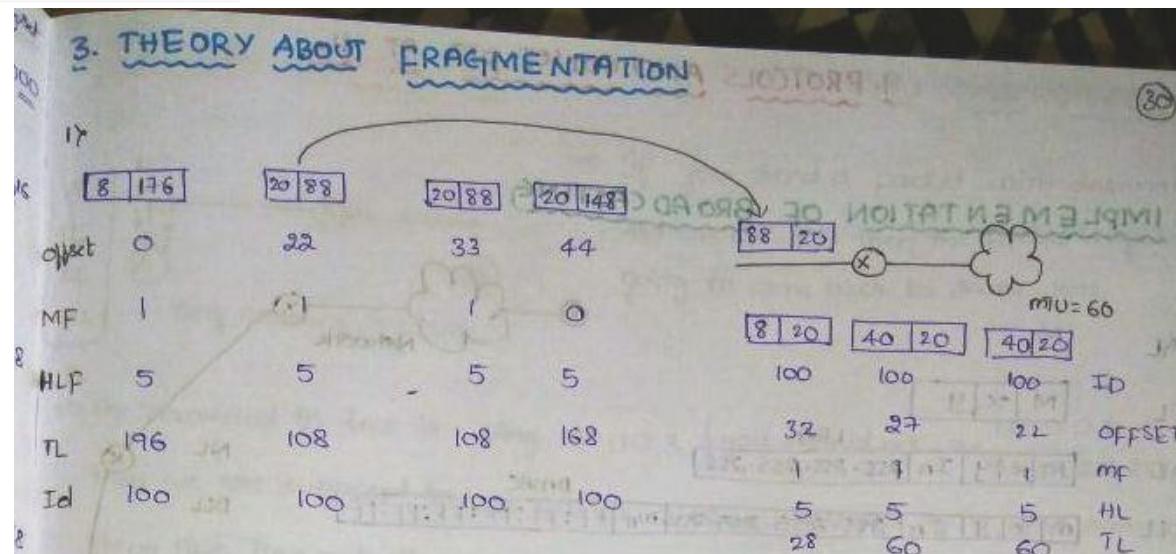

Router can arbitrarily drop the packets due to congestion.

If the fragment offset of the packets in the network layer are 0, 20, 40, 60 and the size of the header is 20B. What will be the size of the packet if all the fragments are reassembled and also there are no padding bytes in the last fragment?

Solution: Ans: 160
Ans: Calculation:
First fragment = 20 + 20 = 40
Second fragment = 20 + 20 = 40
Third fragment = 20 + 20 = 40
Size of fragment = 40 x 3 = 120
Header size = 20
Size of packet = Header + Data = 120 + 20 = 140

g was confused to find the whole length of packet or single fragment length

Source is doing segmentation.

→ Fragmentation is done at Router, not at the source

→ The fragments are reassembled at Destination not routers because, it is a Datagram service and all the routers may not meet at the same router, and there might be a further need for fragmentation.

4. REASSEMBLY ALGORITHM

→ Depending on MF and offset the Receiver will identify that the Datagram is fragmented.

MF	offset	
1	0	→ 1st fragment
1	!0	→ Intermediate fragment
0	!0	→ Last fragment
0	0	→ Only Single Datagram = No Fragmentation.

Step-1: Destination should identify that Datagram is fragmented (MF, offset)

Step-2: Destination should also identify that what fragments belong to a particular Datagram by using Identification number.

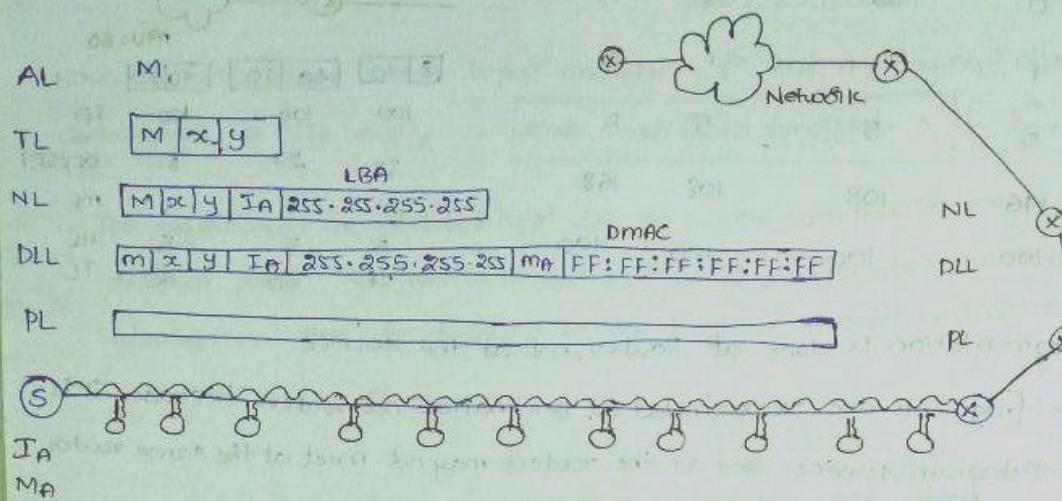

Step-3: Identify the first fragment (MF=1, offset=0) $\frac{[TL - (HL * 4)]}{8}$

Step-4: Identify the subsequent fragments $\frac{[Data + HL]}{8}$ = offset of 2nd fragment

Step-5: Repeat this procedure for all the subsequent packets where MF=0

9. PROTOCOLS AND CONCEPTS AT NL

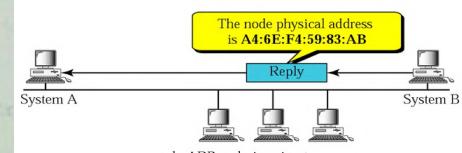

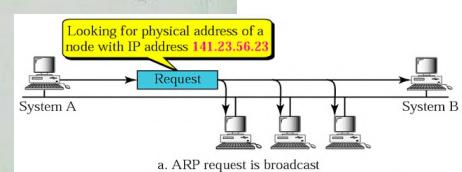

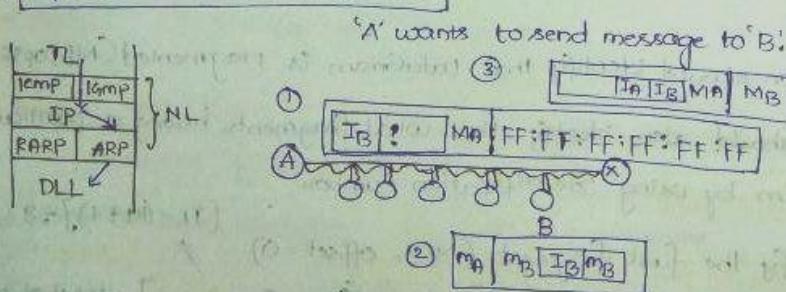

1. IMPLEMENTATION OF BROADCASTING

- ⇒ Even though Broadcasting is done at NL it cannot be done without the Broadcasting features of Data Link layer.
- ⇒ For Direct Broadcasting the field where LBA is present in above figure will be Replaced by DBA and DMAc will be filled by the next router and then router routes the packet as unicast message and when the Router forwards to the Network, then the DBA will be changed to LBA and DMAc will be all f's.

2. ARP

ARP (IP Address → MAC Address)

⇒ ARP Request is a Broadcasting packet

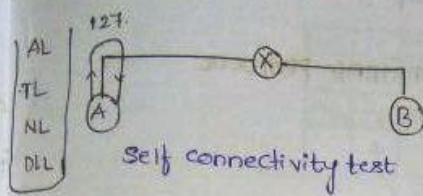

⇒ ARP Reply is a unicast packet

⇒ ARP is applied when a Router wants to find MAC Address of another Router (R-R)

Host wants to find MAC Address of another host (H-H)

Router wants to find MAC Address of another Router (H-R)

3 SPECIAL ADDRESS - 127

⇒ If you send a packet with destination Address as 127 then the packet is again going to come back to same host.

PL

⇒ The command to test is ping 127.0.0.1 {you should not use 127.0.0.0
127.255.255.255} then we are supposed to see RTT as $\geq 15\text{ms}$ instead if it sees some thing like Time out the something is wrong in our NIC and you should start troubleshooting.

⇒ It is also called Loop Back Address

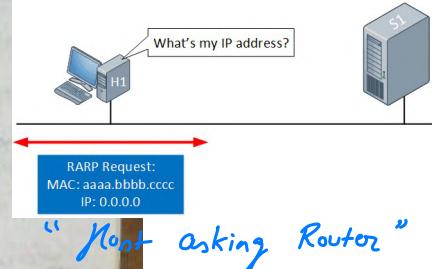

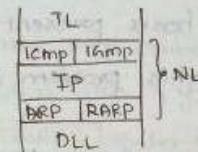

4 RARP

RARP = Reverse ARP (MAC → IP)

NFS = Network File Server

MAC → ROM

IP → RAM

i) The disadvantages of RARP are:

- Every Host should have a RARP server
- Static mapping ($\text{# of IP} > \text{no. of Hosts}$)

OBsolete TECHNOLOGY

Q.10
RARP is used for resolving which address?
Time taken to answer this question 00:00:43 ms

Source mac address
 Destination mac address
 IPv4 network address
Solution: c
Explanation:
The Reverse Address Resolution Protocol (RARP) is an obsolete computer networking protocol used by a client computer to request its Internet Protocol (IPV4) address from a computer network.
 Private IP address
Your answer is Wrong

AL

TL

RARP Request

MAC 0.0.0.0

MAC	IP
M1	I1
M2	I2
M3	I3

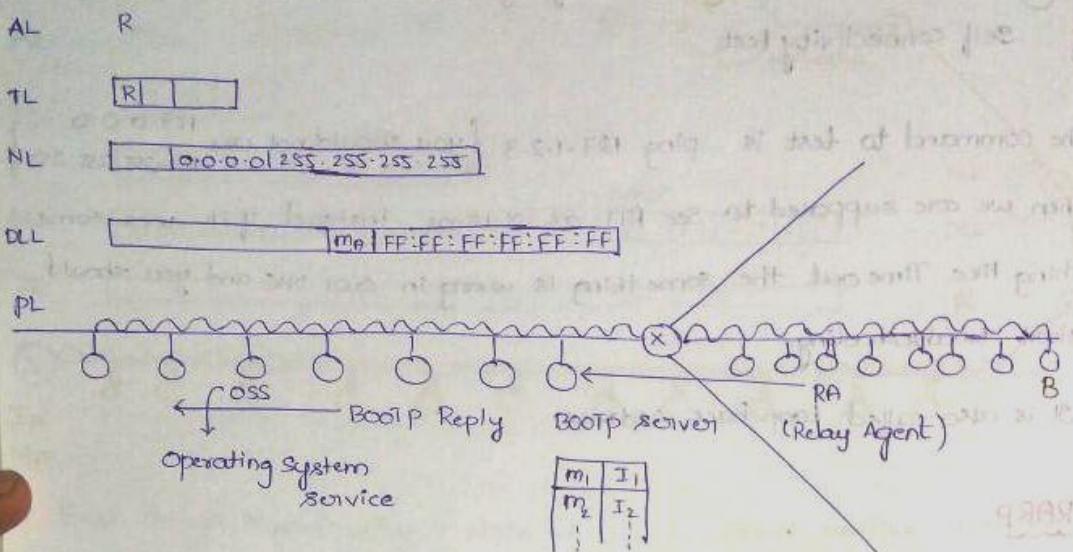

RARP Server

RARP

5. BOOTP AND DHCP

⇒ The main difference between Bootp and RARP is, Bootp works at AL, and RARP works at DLL.

Bootp = BOOTSTRAP PROTOCOL

⇒ Now the hosts present in other NLs are never going to reach the Bootp Server, this problem is solved by Relay Agent.

⇒ The Relay Agent knows the IP Address of the Bootp server and the packet that is Broadcasted by Station B will be Read by RA and RA will ask the Bootp server by sending a Unicast packet.

⇒ Only one Bootp Server is Required

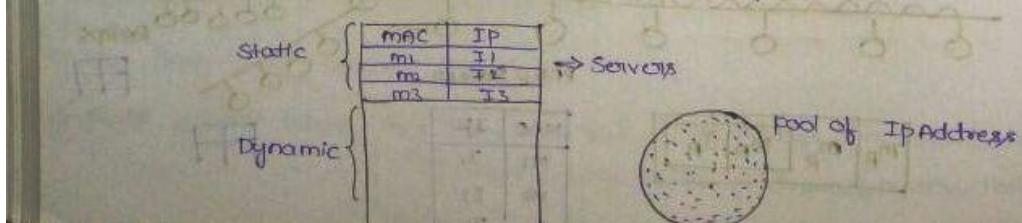

⇒ Mapping table is static.

DHCP

The main diff between the Bootp and Dhcp is the table is not static in Dhcp

⇒ Dhcp has table at Dhcp server and the table has two parts they are static part and dynamic part.

⇒ Generally the servers will be given permanent IP's.

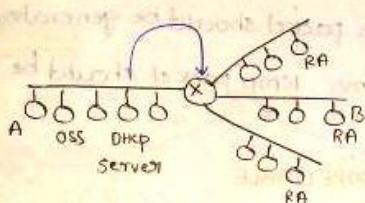

→ Let us say , A host Me wants its Ip Address then the dynamic part look like this

MAC	IP	last time
Mn	Ia	10min
mB	I _B	10min
	4	

→ only one DHCP server is enough

⇒ The Stable is a Dynamic table (No. of IP Address = No. of stations online)

→ To make DHCP backward compatible with BOOTP, both DHCP, BOOTP should have same port numbers.

⇒ Dlcp is operated at Application layer

\Rightarrow DHCP cannot be implemented on Router as Router has only '3' layers

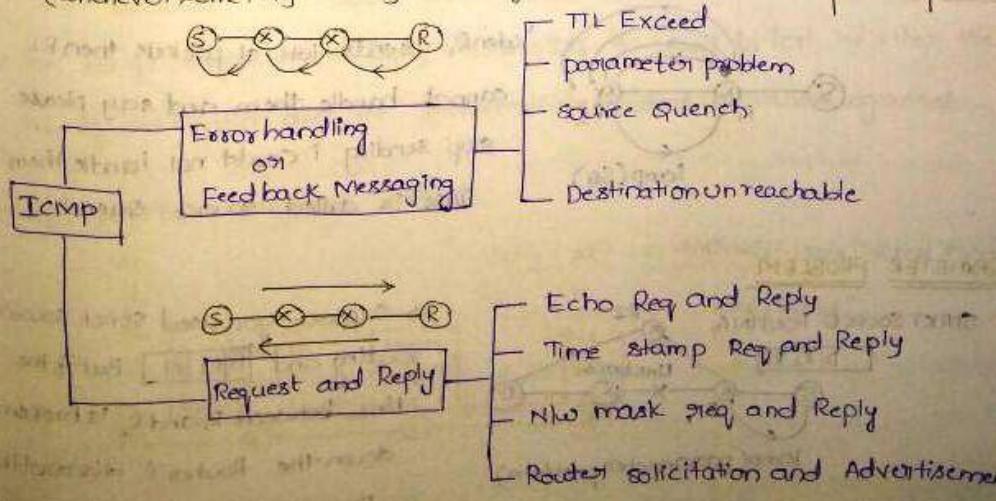

⇒ But practically DHCP can be applied
on the routers also, if you buy
Cisco's **CNSR5** Router you will be
going to be provided with DHCP
facility at Router itself.

6. INTRODUCTION TO ICMP (v. Imp for GATE)

→ ICMP works at Network Layer

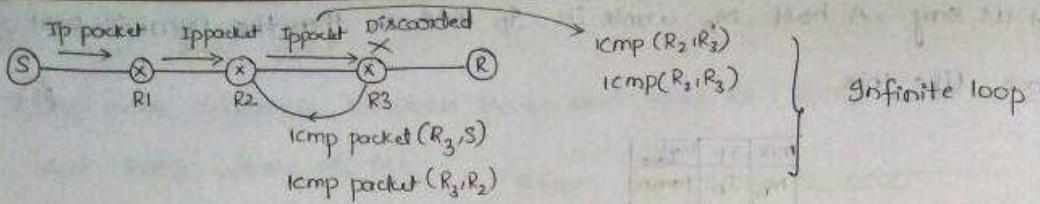

→ ICMP = Internet control message protocol

(whenever something is wrong then we get icmp packet)

Q2. When a datagram (using IPv4) is discarded, an error message is sent to the source using ICMP. The error message includes _____?

- a. The datagram that had an error.
 - b. A data section that includes a copy of the entire IPv4 header, plus at least the first eight bytes of data from the IPv4 packet that caused the error message.
 - c. Only the message that tells there is some error.

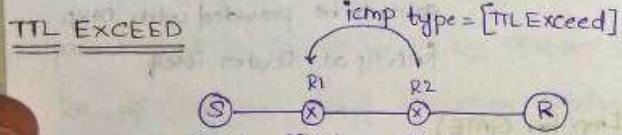

→ Suppose you are sending an IP packet from Source to Receiver but on the way the IP packet is discarded because of heavy congestion at Router R3. Now the Router R3 sends ICMP packet (R3, S) to say to the source that I discarded your packet. Now, the Router R3 sends "ICMP (R2, S)" first to Router R2 but because of heavy congestion at R2 the ICMP packet (R2, S) is discarded at 'R2' so R2 again sends an ICMP packet to R3 and because of heavy congestion at R3 again the ICMP packet is discarded. This scenario will lead to infinite loop.

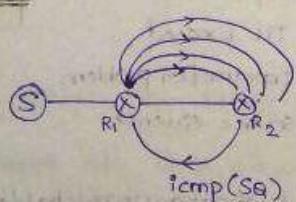

⇒ IP packet is lost the ICMP packet should be generated but if ICMP packet is lost then no ICMP packet should be generated

∴ ICMP + IP UNRELIABLE

7. ICMP FEEDBACK MESSAGING

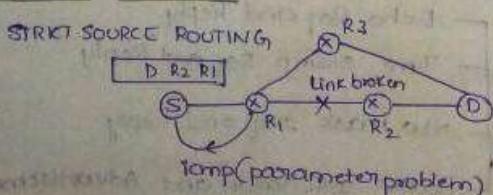

SOURCE QUENCH

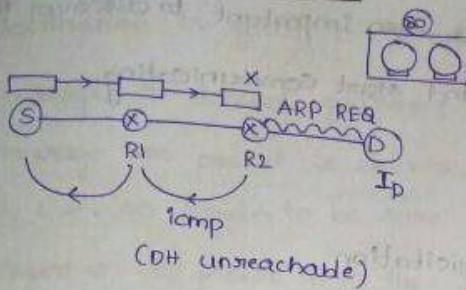

when R1 sends lots of packets then R2 cannot handle them and say please stop sending i could not handle them. This is called source quench.

PARAMETER PROBLEM

⇒ Suppose you used strict source routing and D → R2 → R1. But if the link between R1 and R2 is broken then down the Router R1 discards the packet and sends ICMP message.

BESTINATION UNREACHABLE

→ Destination unreachable is of 2 types they are
③

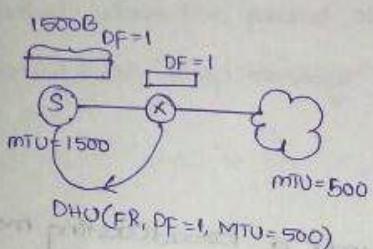

1. Destination Host unreachable

2. Destination port unreachable

→ R2 send ARP Req for getting mac add

If the host is down then there won't be reply then the Router R2 sends icmp

DH unreachable. error message).

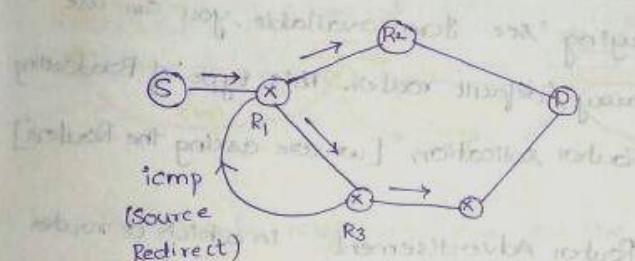

DHU = Destination Host unreachable

DF = Don't fragment = 1

FR = Fragmentation Required.

SOURCE REDIRECT

→ Now source sends a packet to

R₁ and at R₁ due to some errors in the Routing table if it has chosen Router R₂ (actually the best path is "R₁, R₂, D") then

if there is some manual mechanism in R₃ which knows that there is a better path b/w 's' and 'D' then

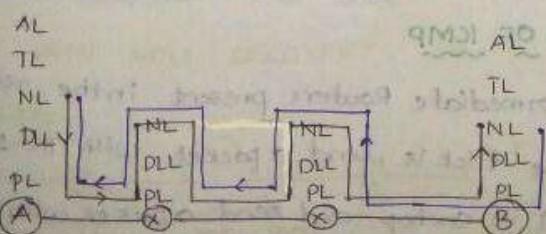

R₃'s send temp packet saying "see there is another better path so you please redirect don't send me next time!"

8. ICMP REQUEST AND REPLY MESSAGING

⇒ The ICMP Request and Reply messaging is used to test whether the

NL of destination and the intermediate routers are working or not

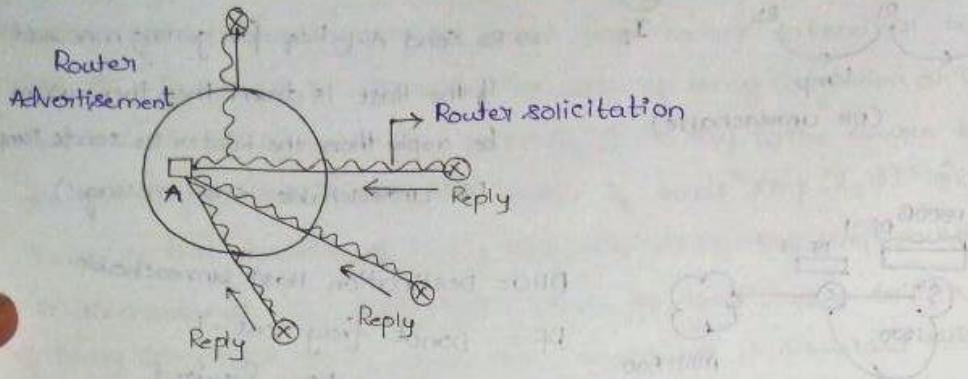

PING : PACKET INTERNET GOFER

Ques: AL → PING uses "ICMP echo"

Req/Reply:

⇒ It is not enough just that you get the IP Address from DHCP when you are connected to internet, it is also important to discover the default Router for your connection and start communicating.

- ⇒ The station present in the Network sends a Broadcasting message to all the Routers which are connected to that particular Network then the Routers reply saying "See I am available, you can use me as your default gateway / default router. This type of Broadcasting the message is called "Router solicitation" [we are asking the Routers]
- ⇒ The other scenario is "Router Advertisement" in which a router connected to a NW, says "See I am available you can use me as your default router.

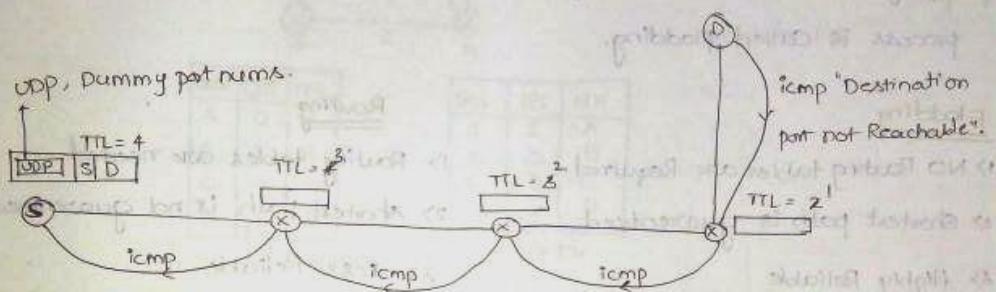

Time Stamp Req and Reply

Generally various Networking devices are placed at different parts of the world. The challenge here is Synchronisation which means it is important to check whether they work at same time, in order to that there is a special type of ICMP message called "Time Stamp Req and Reply" message. This is a obsolete technology and now we are using "Network time protocol".

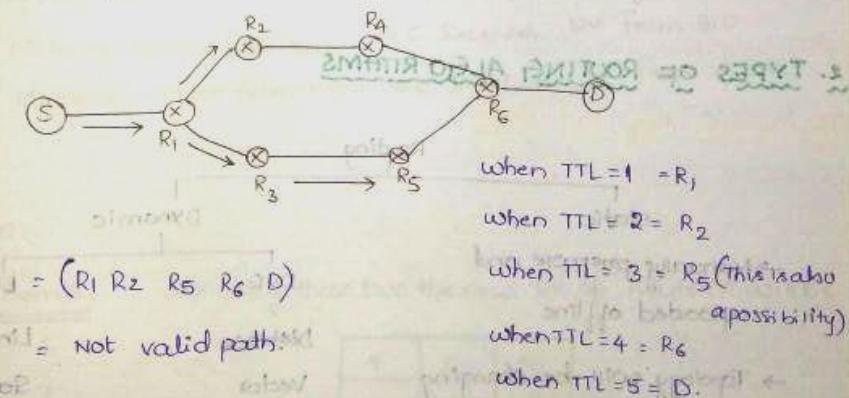

9. TRACE ROUTE, APPLICATION OF ICMP

- ⇒ In order to find the intermediate Routers present in the route between source and destination the trick is, send a packet with TTL=1 in order to get the Router present in one hop, and send a packet with TTL=2 to get the Router present at 2nd hop. When TTL=0 at the router it sends "ICMP TTL exceed" error to the source / end.

→ when the packet reaches the destination, TTL will be zero and the destination is going to accept it but it doesn't generate ICMP message, it does not guarantee that when we don't receive a ICMP message the packet is delivered to the destination, the ICMP may be lost. So in order to be sure whether the packet reached the destination insert a UDP packet into the IP packet and put dummy port numbers so that when the packet reaches destination it is going to accept it and return an "ICMP message" "Destination port unreachable".

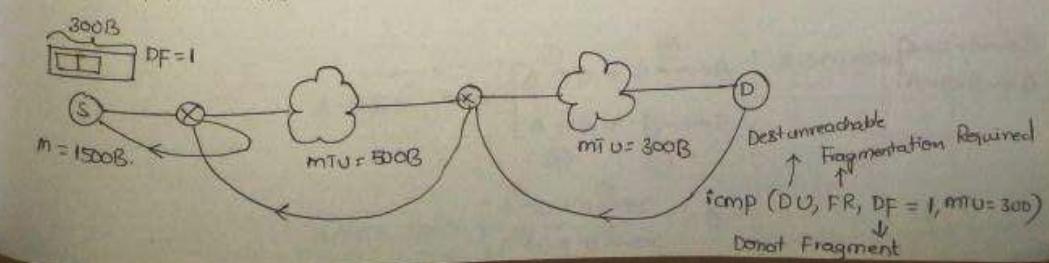

⇒ The Trace route might not give you the actual path, but in almost majority cases we get Actual path. for example

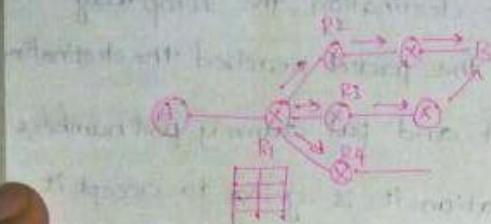

10. PMTUD APPLICATION OF ICMP

PMTDU = PATH MTU DISCOVERY

10. ROUTING

1. DIFFERENCE BETWEEN ROUTING AND FLOODING

→ How does the Router R1 comes to know about the destination, i mean which is the path that it should send the packet so that it will reach destination.

→ The process of building the routing table is called "Routing"

→ If you don't know which way to send, send it in all possible paths, this process is called flooding.

Flooding

- 1> NO Routing tables are Required
- 2> Shortest path is guaranteed.
- 3> Highly Reliable

Disadv

- 1> More Traffic
- 2> Duplicate packets are possible

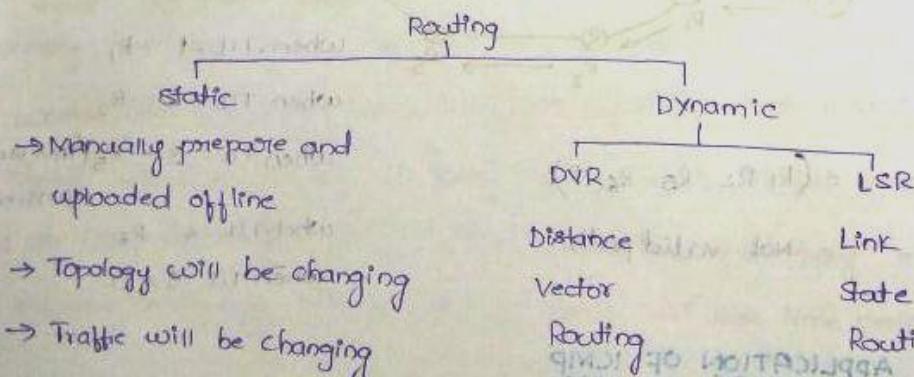

Routing

- 1> Routing tables are needed
- 2> shortest path is not guaranteed
- 3> Less Reliable

Adv

- 1> Less traffic
- 2> No Duplicate packets.

2. TYPES OF ROUTING ALGORITHMS

3. DISTANCE VECTOR ROUTING

(35)

⇒ In the DVR every node is going to know only about its Neighbours.

⇒ The Routing table at a node contains three fields: Destination, Distance, Nexthop

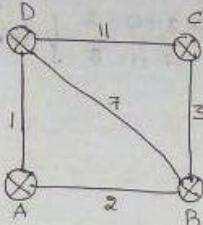

Step 1:

Des	DIS	NH
A	1	A
B	7	B
C	11	C
D	0	D

↳ DV

Des	DIS	NH
A	α	-
B	3	B
C	0	C
D	11	D

↳ DV

→ Building Local Routing table with knowledge of Neighbours.

Des	DIS	NH
A	0	A
B	2	B
C	α	-
D	1	D

Des	DIS	NH
A	2	A
B	0	B
C	3	C
D	7	D

↳ Distance vector

Step 2:

⇒ Every Router will take their distance vectors and exchange with their Neighbours.

⇒ Now at every node the new distance vectors will be newly created.

→ A receives Distance vector from B,D. → C receives DV from B,D.

→ B receives Distance vector from A,C,D. → D receives DV from A,B,C.

At A:

DVs from B,D

From B

From D

⇒ Using these two the new DV of Router A will be

2	1	
0	7	
3	11	
7	0	

	A	B	C	D
A	0	A	-	-
B	2	B	-	-
C	5	B	-	-
D	1	D	-	-

$$A \rightarrow B = \min \left\{ \begin{array}{l} \textcircled{1} A \xrightarrow{D} D \xrightarrow{\textcircled{2}} B \\ \textcircled{3} A \xrightarrow{B} B \xrightarrow{B} B \end{array} \right. \quad A \rightarrow D = \min \left\{ \begin{array}{l} \textcircled{1} A \xrightarrow{D} D \xrightarrow{\textcircled{2}} D \\ \textcircled{3} A \xrightarrow{B} B \xrightarrow{B} D \end{array} \right.$$

$$A \rightarrow C = \min \left\{ \begin{array}{l} \textcircled{1} A \xrightarrow{D} D \xrightarrow{\textcircled{2}} C \\ \textcircled{3} A \xrightarrow{B} B \xrightarrow{C} C \end{array} \right. = 5$$

The shortcut is

At A:

A	0	A
B	2	B
C	5	B
D	1	D

→ Exception

Take the min of = 2

$$\begin{aligned} 2+0 &= 2 \\ 7+1 &= 8 \end{aligned} \quad \min = 2 \text{ from 'B' table}$$

∴ NH = Next Hop = B

At B:

DIVS from A,C,D

At B:

From A

A	0
B	2
C	5
D	1

AB: 2
By

From C

B	0
C	3
D	11

BC: 3 add

From D

A	1
B	7
C	11
D	0

BD: 7 add

The New Routing table At B is

A	2	A
B	0	B
C	3	C
D	3	A

$$= \min \{2, (3+1), (1+7)\}$$

$$= \{2, 0, 8\} = \{2\} \text{ from A}$$

⇒ Repeat this procedure at every node and do it for 3 times (3 Rounds)

because the shortest path is of 3 edges. ⇒ no. of (nodes - 1). So

Repeat the rounds for $(n-1)$ times {n = no. of nodes}

The final Routing table is after everything converges is,

At A:

A	0	A
B	2	B
C	5	B
D	1	D

At B:

A	2	A
B	0	B
C	3	C
D	3	A

At C:

A	5	B
B	3	B
C	0	C
D	6	B,A

At D:

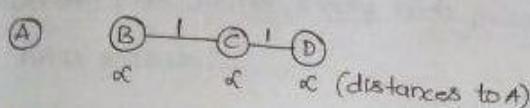

A	1	A
B	3	A
C	6	A,B
D	0	D

Problem

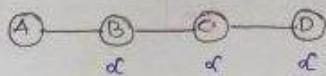

4. COUNT TO INFINITY

→ There is a problem with DVR the problem is called count to infinity

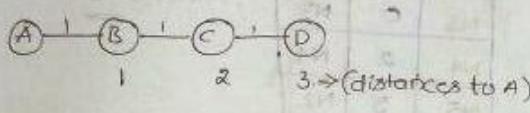

Initially

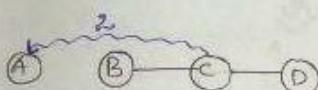

Step-1
Suppose if 'B' is connected to A

Exchange of DV's

Now, suddenly if the link between A, B is down, then it is a Bad news.

1 2 3 (Initial values before the link is broken)

$\infty \leftrightarrow 2 \leftrightarrow 3$. (Here is the trap, we know that the Routing tables

dist from 3 $\leftrightarrow 4 \leftrightarrow 3$ are exchanged in neighbours. Here, B says i cannot reach A via C. 5 $\leftrightarrow 4 \leftrightarrow 5$ (i.e., B says don't worry i'm able to reach A in 2 hops).

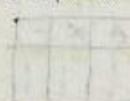

5 $\leftrightarrow 6 \leftrightarrow 5$.

7 $\leftrightarrow 6 \leftrightarrow 7$.

Distances $\leftarrow 7 \leftrightarrow 8 \leftrightarrow 7$

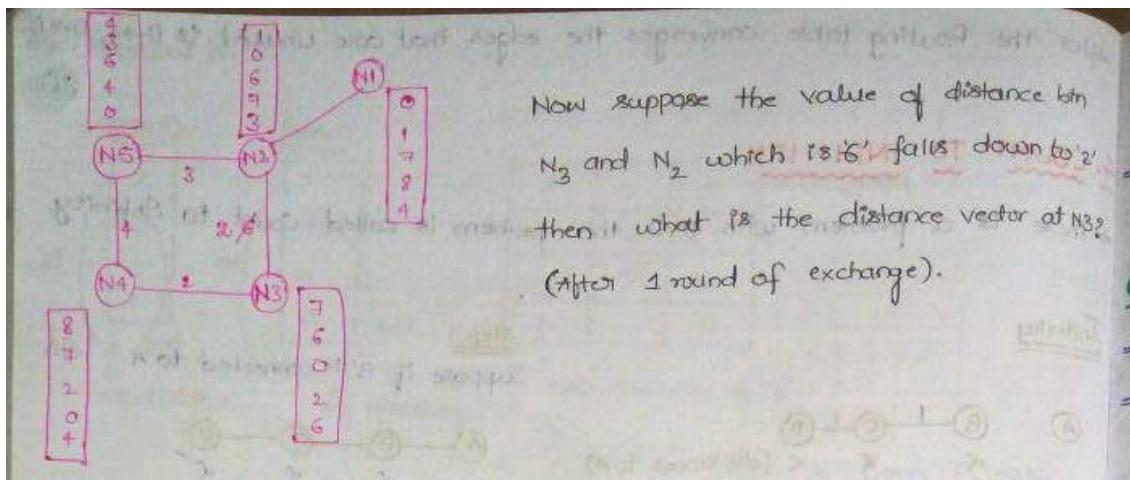

from that node 9 $\leftrightarrow 8 \leftrightarrow 9$

to A: 9 10 9

\rightarrow This will execute till the value that you have chosen for infinity

Now the above explanation can be understood by the explanation given below. This Question is asked in GATE

At N₃:

From N₂

1
0
6
7
3

N₃ N₂: 2

From N₄

8
7
2
0
4

N₃ N₄: 2

New routing table at N₃ is

N1	3	N2
N2	2	N2
N3	0	N3
N4	2	N4
N5	5	N2

Ans: 3 2 0 2 5

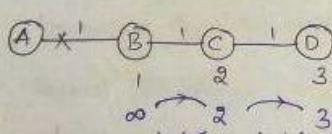

Solution

5. SPLIT HORIZON

⇒ The solution to count to infinity is split horizon.

⇒ The count to infinity also creates some loops.

The routing tables at A, B, and C will be

A	∞	-
B	!	!
C	!	!

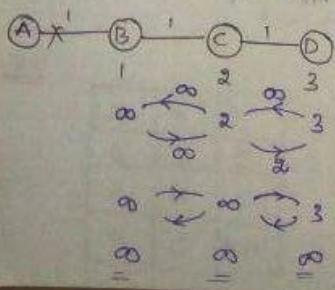

A	2	B
B	!	!
C	!	!

Initially

A	3	C
B	!	!
C	!	!

→ This procedure repeats until all the values are stabilized.

So this problem can be solved by sending the Next hops also and this procedure is called split horizon.

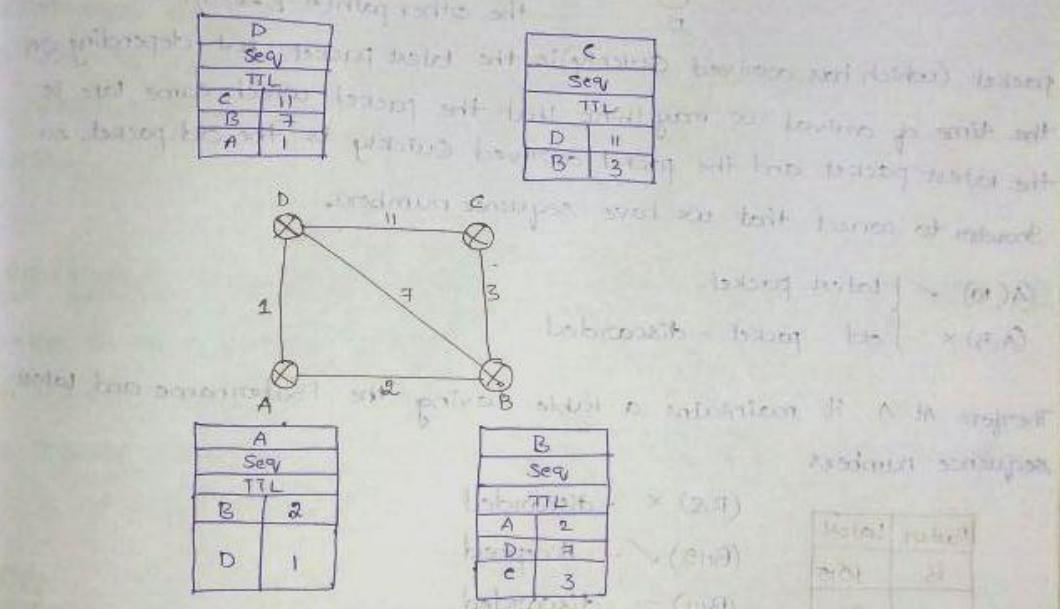

→ Now, At 'C', C is depending on B in order to goto 'A' ∵ when 'C' is already depending on 'B' to goto 'A' it should not say i can take 'B' in some hope; i am already depending on 'B' so please don't ...

- By using the method of split horizon convergence is fast, no loops are formed.
- In case of DVR convergence is slow and loops will occur. (27)

6. LINK STATE ROUTING

- Every Router will create something called as Link state packets.
- In the first round, Every node creates a Link state packets with the help of "Hello packets".

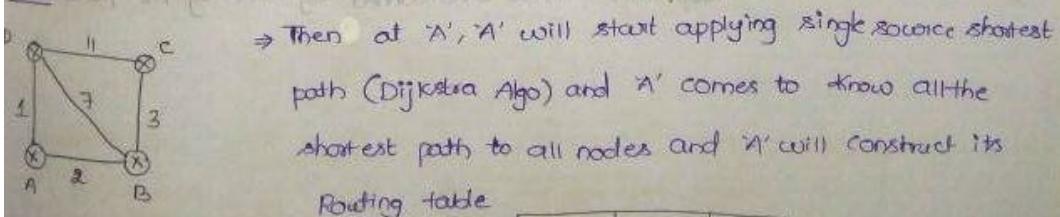

- In ROUND 2 EVERY NODE IS SUPPOSED TO FLOOD THE INFO TO EVERY OTHER NODE. THEREFORE WE WILL HAVE GLOBAL DATABASE AT EACH NODE.

DVR- Local Knowledge (Knows only about the Neighbours)

LSR- Global Knowledge (Knows about all the nodes)

AAA: Best effort delivery, delivery not guaranteed

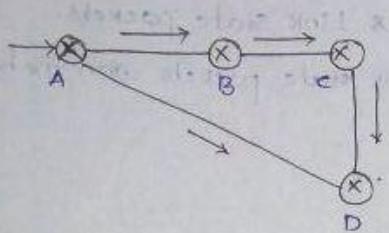

DES	DIS	NH
A	0	A
B	2	B
C	5	B
D	1	D

⇒ LSR converges faster compared to DSR

⇒ There are some problems in the LSR, since we are flooding, it is going to lead heavy traffic.

⇒ Now, consider the following scenario,

Now if a packet is flooded from 'A' to all the nodes then the packet will reach 'D' in less time when compared with the other path (A-B-C-D), so the arrived packet (which has arrived quickly) is the latest packet but depending on the time of arrival we may think that the packet which came late is the latest packet and the packet arrived quickly is the old packet. So in order to correct that we have sequence numbers.

(A, 10) ✓ } latest packet
(A, 5) ✗ } old packet - discarded.

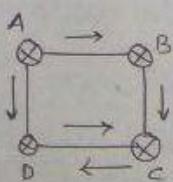

Therefore At A, it maintains a table having the Router name and latest sequence numbers.

Router	Latest
B	10/15
C	20
D	30

(B, 8) ✗ - discarded
(B, 15) ✓ - Accepted
(B, 11) - discarded

1	2	3
4	5	6
7	8	9

Now,

⇒ The packet that is already sent to 'D' from 'A' is going to come again to the same destination via another route (A-B-C-D) so there is a problem of falling in infinite loop. This can be overcome by having TTL field.

I. DIFFERENCE BETWEEN DVR, LSR, RIP AND OSPF

DVR

- 1) used in 1980's
- 2) BW required is less
- 3) local knowledge
- 4) Bellman Ford Algo
- 5) less Traffic
- 6) periodic updates
- 7) converges slowly
- 8) count to infinity
- 9) persistent loops
- 10) RIP

II) RIP Uses UDP

LSR

1. used in 1990's
2. High Bandwidth
3. Global knowledge
4. Dijkstra Algo
5. high Traffic
6. periodic updates
7. converges fast
- 8) No count to infinity
- 9) Transient Looping
- 10) OSPF

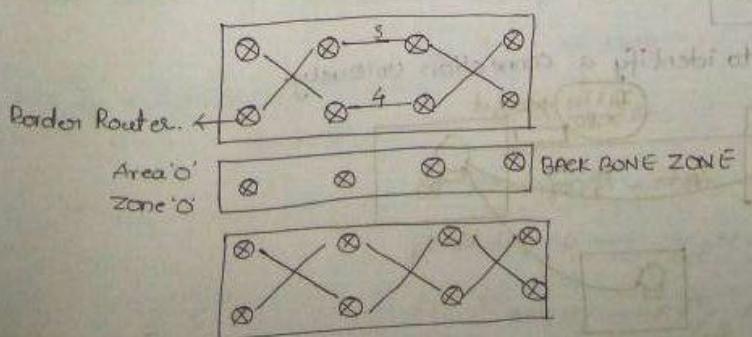

II) OSPF doesn't use UDP or TCP.
It sends directly via IP.

RIP (ROUTING INFORMATION PROTOCOL) (2) Intra-domain routing

- ⇒ RIP is the implementation of (DVR) simple to implement but if you
- ⇒ Metric = Hopcount (weights)
- ⇒ infinity cannot be represented in programming language hence the value 16 is used as infinity.

OSPF

- ⇒ OSPF is the implementation of the (LSR) computation is complex
- ⇒ OSPF divides all the routers into some Regions and flooding is restricted to that Region, and there will be one router designated as "Border Router" (It will take all the flooded packet and summarize the info).
- ⇒ Border Router is connected to "Area 0" or "Zone 0" or "Back Bone Zone".
- ⇒ "EIGRP" protocol invented by CISCO $EIGRP = RIP + OSPF$

II. TCP

1. TCP HEADER

SOURCE PORT (16)	DESTINATION PORT (16)	= 4 Bytes
SEQUENCE NUMBER (32)		= 4 Bytes
ACKNOWLEDGE NUMBER (32)		= 4 Bytes
HEADER LENGTH RESERVE URGENT PUSH RECEIVED SYN FIN WINDOW SIZE (16) ADV WINDOW (16)		= 4 Bytes
CHECK SUM(16)	(16) URGENT POINTER	= 4 Bytes
OPTIONS (0-40) Bytes		= 40 Bytes
DATA		

4 bits

∵ Max header length in Tcp = 60 Bytes

∵ Min. header length in Tcp = 20 Bytes

2. SOURCE PORT, DESTINATION PORT AND SOCKET

⇒ Tcp is End-End protocol because of having port numbers.

⇒ port numbers are used for multiplexing and Demultiplexing.

⇒ SP DP
16 16

[0 to $(2^{16}-1)$] ports can be represented

$$= (0, 65535)$$

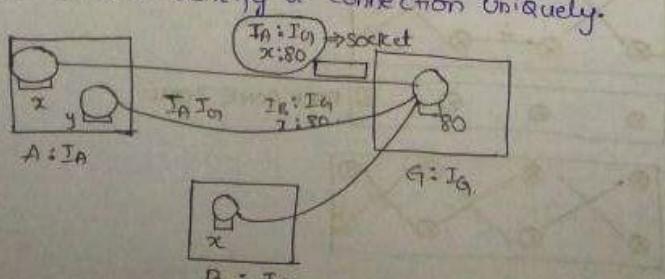

Http: 80	○	well known services port number
FTP: 21	1023	
Telnet: 23	1024	
Smtp: 25	49, 151	Reserved
	49, 152	
	65, 535	General public

⇒ open your browser and type "Net stat" to see all the connections, and port numbers (source port number, destination port number).

⇒ Tcp is connection oriented protocol (Resources are Reserved).

$$\Rightarrow \boxed{\text{Socket} = \text{IP} + \text{portnum}} = 32 + 16 = 48 \text{ bits}$$

⇒ Sockets are used to identify a connection uniquely.

Counting of every byte

3. SEQ.NO, ACK.NO., RANDOM INITIAL SEQ.NO

- ⇒ TCP is a Byte Stream protocol.
- ⇒ IP is a packet Stream protocol.
- ⇒ HDLC(DLL) is a Bit Stream protocol.

⇒ In TCP the data bits are numbered. The seq.no field contains the value of starting data bit.

⇒ ACK field is used when the sender sends the TCP packet and is waiting for acknowledgement. ACK field contains the value of the data bit that is expected next (seq.no of the byte expected to come next).

TCP uses Random sequence no. to deal with late packets of previous sessions

Sequence Numbering:

- Sender (S):** Sequence numbers range from 0 to 999. It sends segments with seq=0, seq=100, seq=200, seq=300, seq=400, seq=500, seq=600, seq=700, seq=800, seq=900, seq=1000.
- Receiver (R):** Sequence numbers range from 0 to 999. It receives segments with seq=0, seq=100, seq=200, seq=300, seq=400, seq=500, seq=600, seq=700, seq=800, seq=900.

Sequence Numbering:

- Sender (S):** Sequence numbers range from 0 to 999. It sends segments with seq=0, seq=100, seq=200, seq=300, seq=400, seq=500, seq=600, seq=700, seq=800, seq=900, seq=1000.
- Receiver (R):** Sequence numbers range from 0 to 999. It receives segments with seq=0, seq=100, seq=200, seq=300, seq=400, seq=500, seq=600, seq=700, seq=800, seq=900.

TCP USES USE ANY RANDOM SEQUENCE NUMBER

4. WRAP AROUND TIME AND PROBLEMS ON WRAP AROUND TIME

- ⇒ Wrap around is nothing but using up all the seq.nos present and reusing the seq.nos that have already been used is called wraparound. From this we get "wrap around time".

WAT

- ⇒ Wrap Around Time (WAT) depends on the Bandwidth.
- ⇒ Seq. NOS field contain 32 bits $\Rightarrow 2^{32}$ seq.nos are possible.
- ⇒ Now, Let us say Bandwidth = 1 MBps

$$\Rightarrow 1 \text{ sec} - 1 \text{ MB}$$

$$\text{WAT of } n \text{ seq.nos} = \frac{n}{\text{Bandwidth}} \Rightarrow 10^6 \text{ B} - 1 \text{ sec}$$

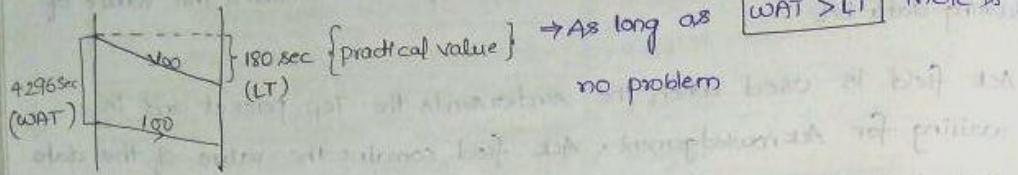

$$\Rightarrow 10^6 \text{ seq.nos} - 1 \text{ sec}$$

$$\Rightarrow 1 \text{ seq.no} - \frac{1}{10^6} \text{ sec}$$

$$\Rightarrow 2^{32} \text{ seq.no} - \frac{2^{32}}{10^6} \text{ sec} = 4296.967296 \text{ sec}$$

→ In today's internet there is a concept called Lifetime which means if you send a packet now the packet will be alive for sometime (3 min) which means at worst case it will reach after 3 minutes after you send it.

$$LT = 3\text{ min} = 180\text{ sec}$$

II.

Let us consider $WAT = 2^{32} = 4,294\text{ sec}$

$$BW = 1\text{ Gbps} = 10^9\text{ Bps}$$

$$\Rightarrow 1\text{ sec} \rightarrow 1\text{ GB}$$

$$\Rightarrow 10^9\text{ B} \rightarrow 1\text{ sec}$$

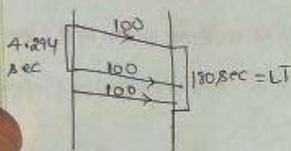

$$\Rightarrow 10^9\text{ Seq.no} \rightarrow 1\text{ sec}$$

$$\Rightarrow 1\text{ Seq.no} = \frac{1}{10^9}\text{ Seq.no}$$

$$\Rightarrow 2^{32}\text{ Seq.no} = \frac{2^{32}}{10^9} = 4.294\text{ sec}$$

$$\text{Life time} = 180 \text{ seconds}$$

$$\Rightarrow \text{Here } WAT \ll LT$$

Now, to solve the above problem, the possible solution is Decreasing the Bandwidth, But this is not possible because we are interested in having high Bandwidth (The speed at which the data gets transferred) so the other possible solution is increasing the ^{bits in the} Sequence no field.

$WAT > LT \Rightarrow$ No problem.

$WAT < LT \Rightarrow$ problem \Rightarrow so calculate how many seq.nos are transmitted in 180 sec

$$\Rightarrow 1\text{ sec} \rightarrow 1\text{ GB}$$

$$\Rightarrow 180\text{ sec} \rightarrow 180\text{ GB}$$

$$\Rightarrow 180\text{ sec} \rightarrow 180 \times (1\text{ GB})$$

∴ The min seq.nos required to avoid wraparound within Life time

$$= 180 \times 1\text{ GB}$$

$$\therefore \text{The No.of bits in seq.no field is } = \lceil \log_2(180 \times 1\text{ GB}) \rceil = 42$$

∴ The no.of additional bits needed to avoid above problem = $42 - 32 = 10$

[These 10 bits are used in options and called as Time stamp]

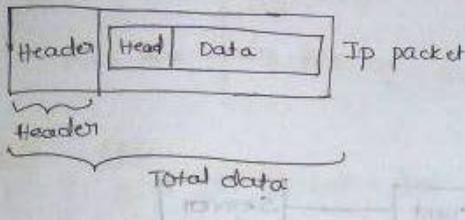

Additional bits are stored in options

→ The no. of bits in the sequence no field such that there won't be any problem with WAT and LT, given at bandwidth Bw is $\lceil \log_2(LT * Bw) \rceil$

5. HEADER LENGTH AND CALCULATION OF ACKNOWLEDGMENT NUMBERS

→ Header length field is 4 bits, but the min size of the header is 20B

→ Scaling factor of $\frac{60}{15} = 4$ is used. $\left\{ \begin{array}{l} \text{max size of header} \\ \text{largest no by 4 bits} \end{array} \right. = \text{scale factor}$

SEQ.NO: Seq.no of 1 Byte

ACK.NO: Seq. no of Byte expected next.

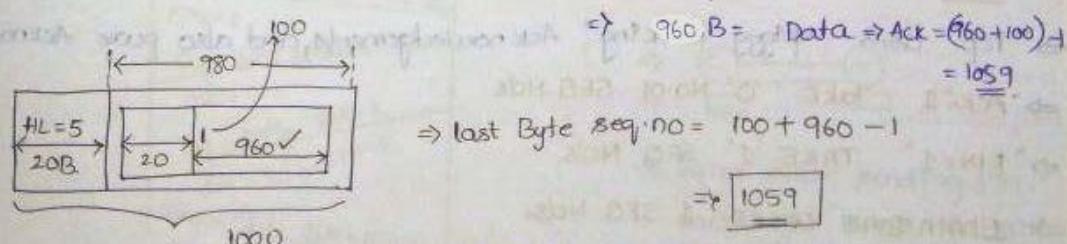

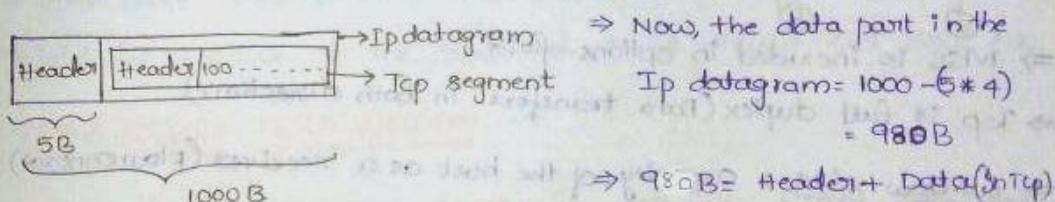

PROBLEM

$$TL = 1000 \text{ B} \quad \left. \begin{array}{l} \text{for IP Datagram} \\ \text{HLF} = 5 \end{array} \right.$$

$$\left. \begin{array}{l} \text{HLF} = 5 \\ \text{Seqno of TCP Segment} = 1000 \text{ B} \end{array} \right\} \text{for TCP Segment}$$

then what is the seq.no of the next byte expected?

Ans: TCP segment will be in the IP Datagram

6. TCP CONNECTION ESTABLISHMENT

⇒ Flags are nothing but 1 bit information, TCP is connection oriented.

SYN (Synchronization Flag)

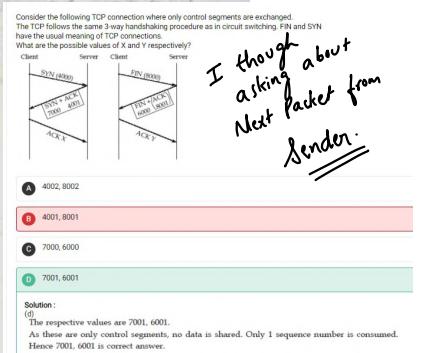

ACK (Acknowledgement Flag)

Now, TCP is connection oriented protocol and it has 3 phases,

1) Connection Establishment

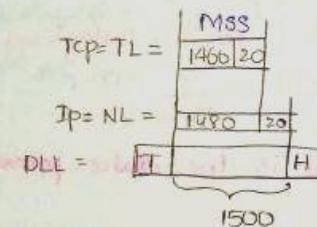

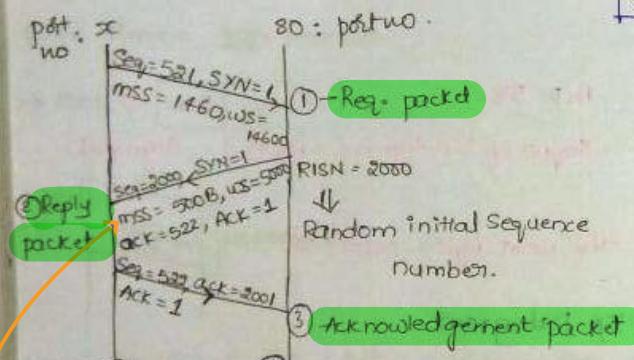

2) Data Transfer

3) Connection Termination.

I thought about
Next packet from
Lender.

CONNECTION ESTABLISHMENT

→ Bottleneck of Data of Link (1500)

⇒ MSS is included in options field.

⇒ TCP is full duplex (Data transfers in both directions).

⇒ window size : capacity of the host as a receiver (flow control).

⇒ "SYN" PACKET WILL EATUP 1 SEQ NUMBER.

⇒ TCP uses "piggy Backing" Acknowledgements, and also pure Acknowledgment.

⇒ "ACK=1" TAKE '0' NO. OF SEQ.NOS

⇒ "FIN=1" TAKE '1' SEQ.NOS.

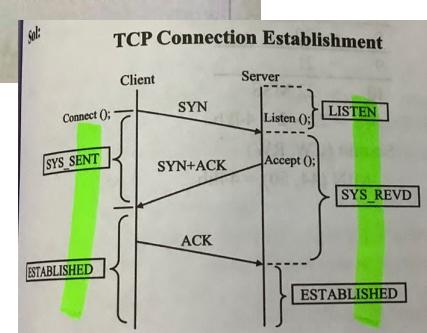

⇒ 1 DATA BYTE TAKES '1' SEQ.NOS.

⇒ THIS METHOD OF CONNECTION ESTABLISHMENT IS CALLED "3-WAY HANDSHAKE" PRINCIPLE.

Only 'Syn', 'Fin', Data consume sequence no.

An acknowledgement by TCP sender guarantees

- ✓ Data has been delivered to the application
- Data has been received by TCP module

Primitive	Packet sent	Meaning
LISTEN	(none)	Block until some process tries to connect
CONNECT	CONNECTION REQ.	Actively attempt to establish a connection
SEND	DATA	Send information
RECEIVE	(none)	Block until a DATA packet arrives
DISCONNECT	DISCONNECTION REQ.	Request a release of the connection

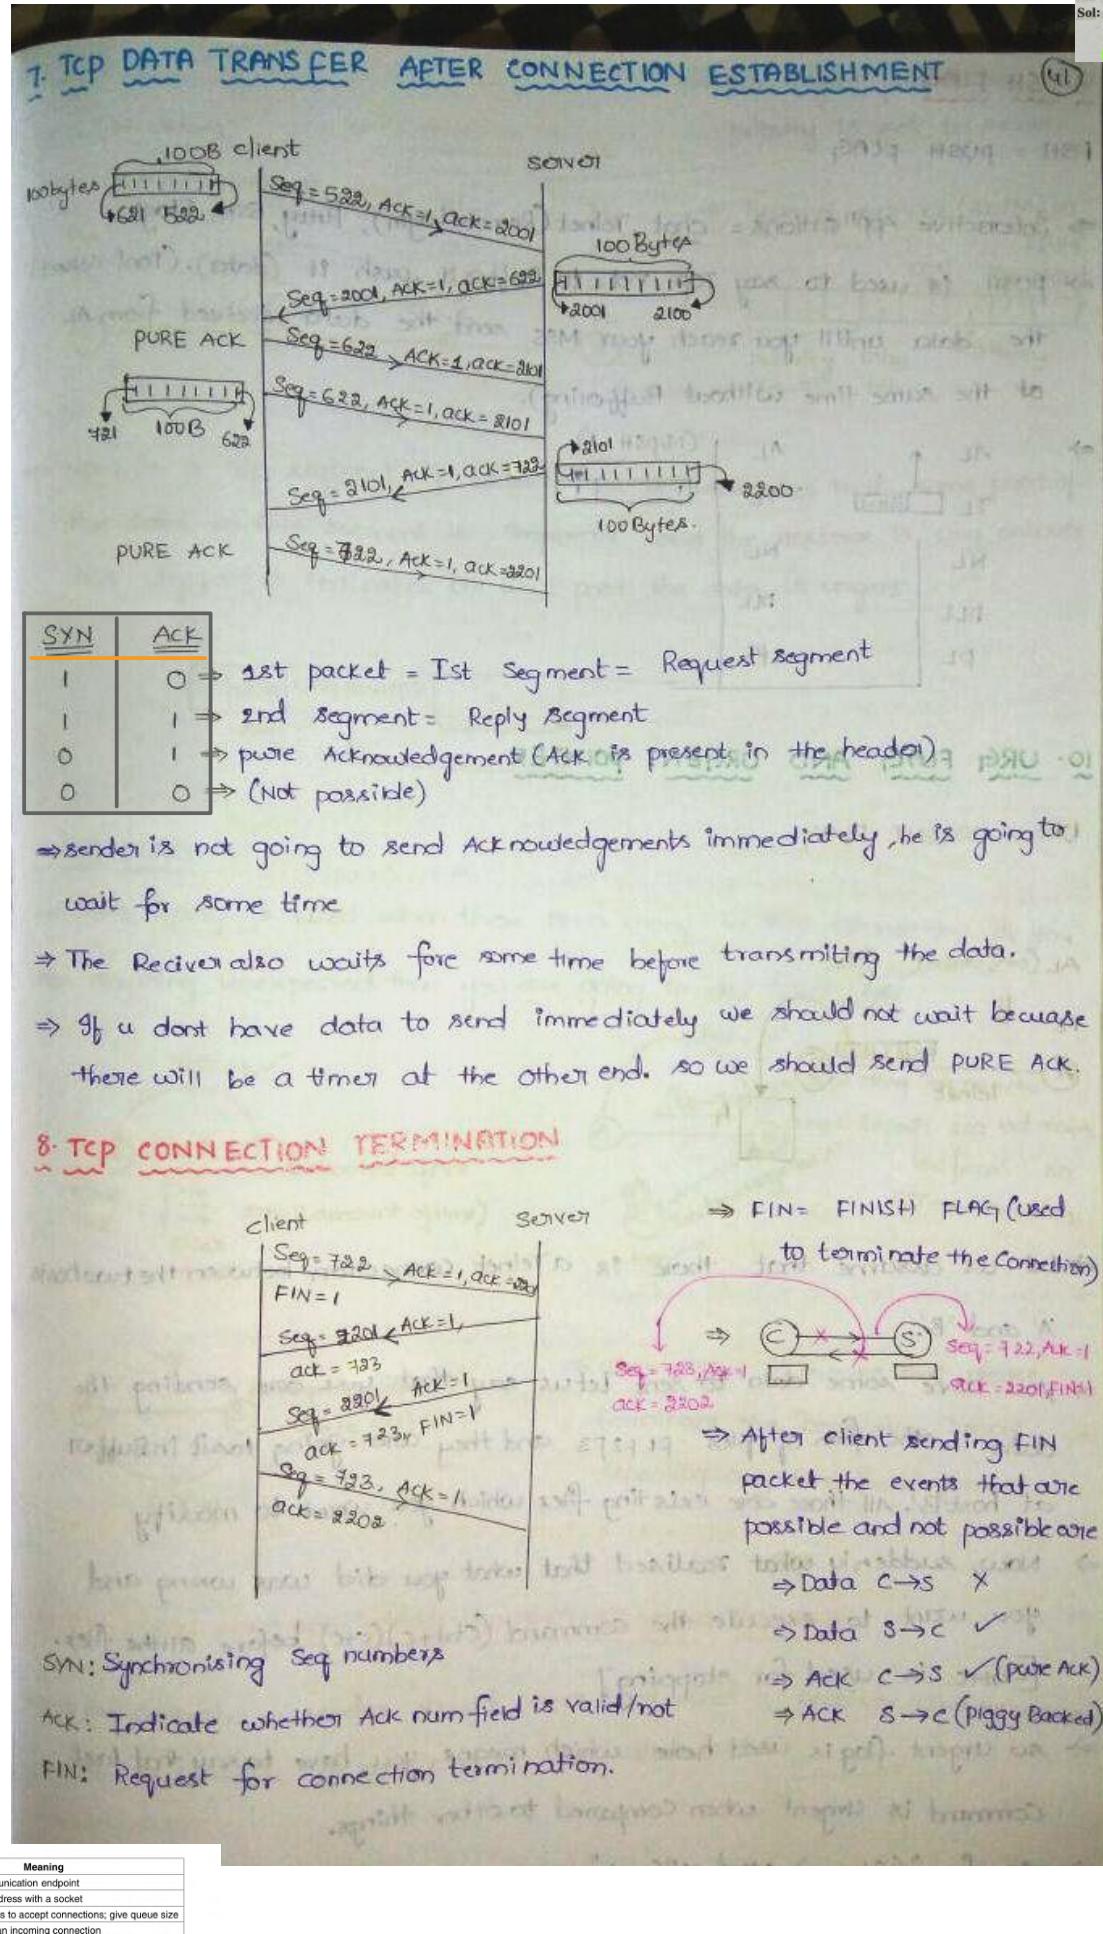

Figure 6-2. The primitives for a simple transport service.

09. Identify the correct order in which a server process must invoke the function calls accept, bind, listen, and recv according to UNIX socket API. (GATE-15-Set2)

- (a) listen, accept, bind, recv
- (b) bind, listen, accept, recv
- (c) bind, accept, listen, recv
- (d) accept, listen, bind, recv

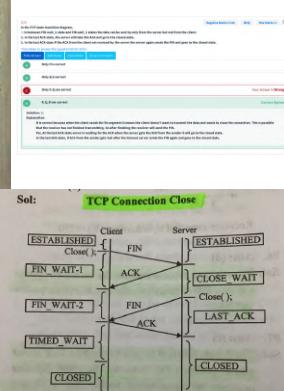

09. Ans: (b)

Sol: TCP bind() binds port and socket, then TCP listens on socket, accept connection and then receive data. So sequence is bind(), listen(), accept(), recv()

Primitive	Meaning
SOCKET	Create a new communication endpoint
BIND	Associate a local address with a socket
LISTEN	Announce willingness to accept connections; give queue size
ACCEPT	Passively establish an incoming connection
CONNECT	Actively attempt to establish a connection
SEND	Send some data over the connection
RECEIVE	Receive some data from the connection
CLOSE	Release the connection

Figure 6-5. The socket primitives for TCP.

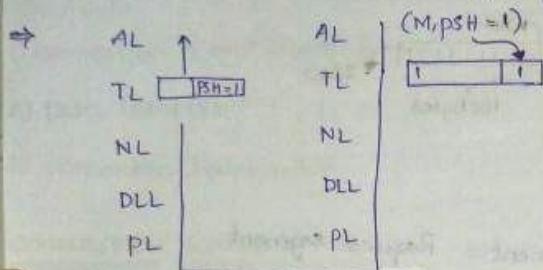

9. PSH FLAG

PSH = PUSH FLAG

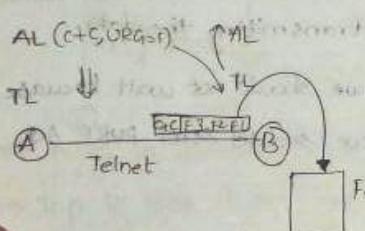

⇒ Interactive Applications = chat, Telnet (Remote Login), Putty, SSH, Rlogin.

⇒ PUSH is used to say TCP not to Buffer it, push it (data). (Don't collect the data until you reach your MSS send the data received from AL at the same time without Buffering).

10. URG FLAG AND URGENT POINTER

URG = URGENT FLAG

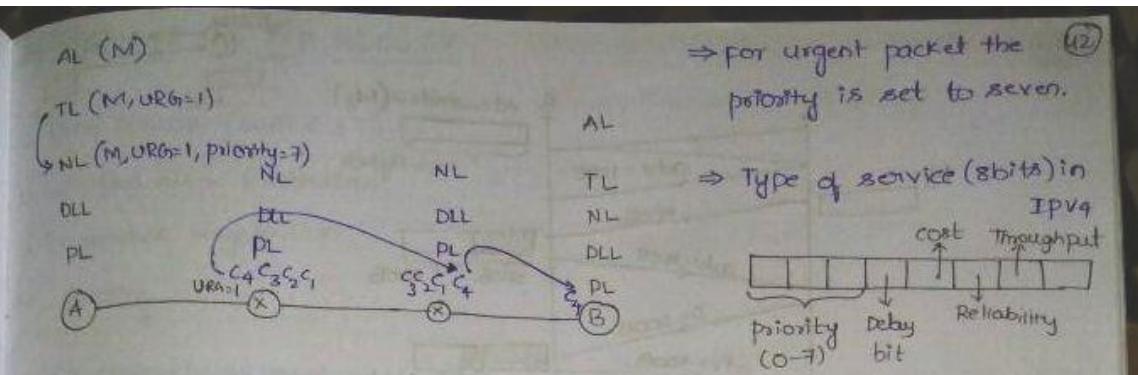

⇒ Let us assume that there is a Telnet connection between the two hosts 'A' and 'B'.

⇒ You have some data to send. Let us say that you are sending the data in the form of files F1 F2 F3 and they are going to sit in Buffer at host B. All those core existing files which you want to modify

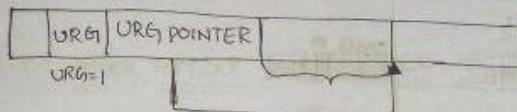

⇒ Now, suddenly you realised that what you did was wrong and you want to execute the command (Ctrl+c)(c+c) before all the files. [Ctrl+c is used for stopping]

⇒ So Urgent flag is used here, which means you have to say that last command is urgent when compared to other things.

⇒ So for "(Ctrl+c) send URG=1"

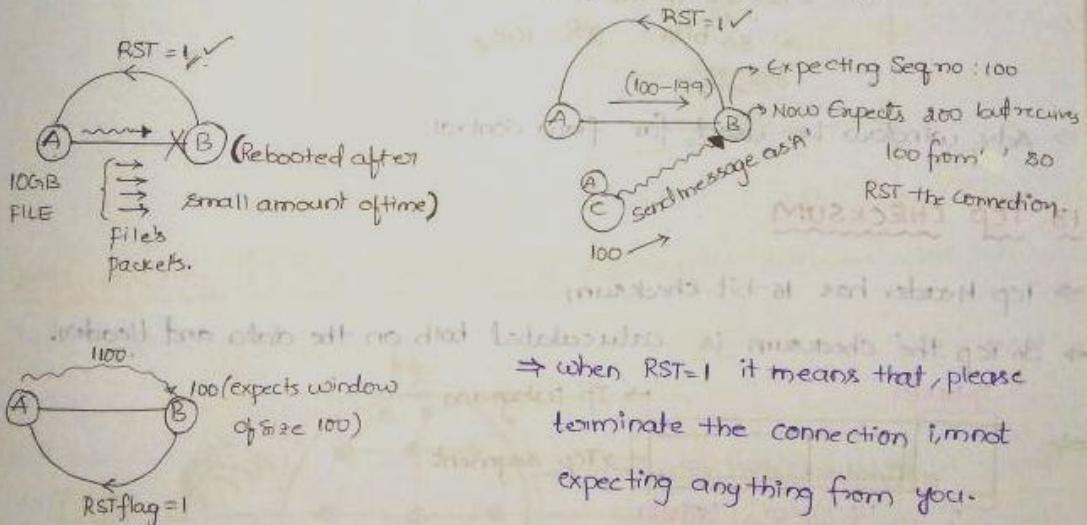

→ Now, In a Tcp segment if URG=1 then it indicates that some part of the data in this segment is important and the next one is urg pointer this urg pointer indicates till what posit the data is urgent.

1ST FLAG

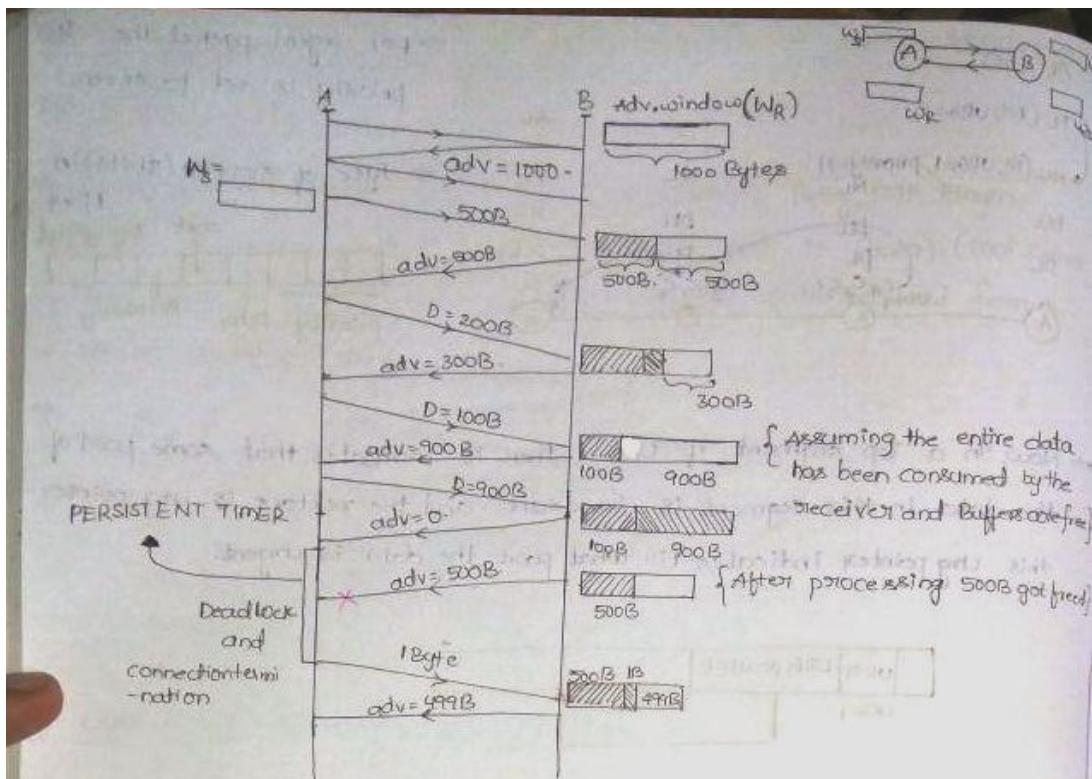

⇒ RESET flag is used when there is a wrong in the connection. If you see anything unexpected then you are going to use Reset flag.

12. TCP FLOW CONTROL USING ADVERTISEMENT WINDOW

⇒ Flow control, a sender should never send what a receiver can't receive.
for that reason we are going to use window size.

useful in flow control

⇒ The window size is 16 bits \Rightarrow Max no. $= 2^{16}-1 = 65,535$

$$\begin{aligned} & \text{16 bits} \\ & = 16 + 14 \text{ (options)} \\ & = 30 \text{ bits} = 2^{30} = 1GB. \end{aligned}$$

DRAFT T2R

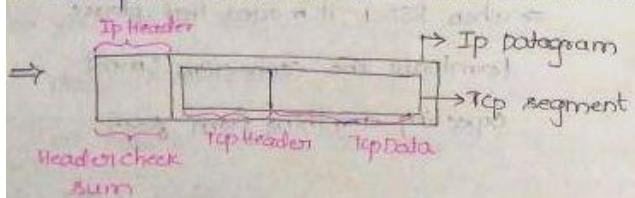

⇒ Adv window is used for flow control.

13. TCP CHECKSUM

→ for Double Checking

⇒ TCP Header has 16-bit checksum.

⇒ In TCP the checksum is calculated both on the data and header.

only some field of IP header

Pseudo IP Header

Pseudo IP Header		
SIP(32)	DIP(32)	
000 Protocol (TCPsegment Length (8) (8) (16)		

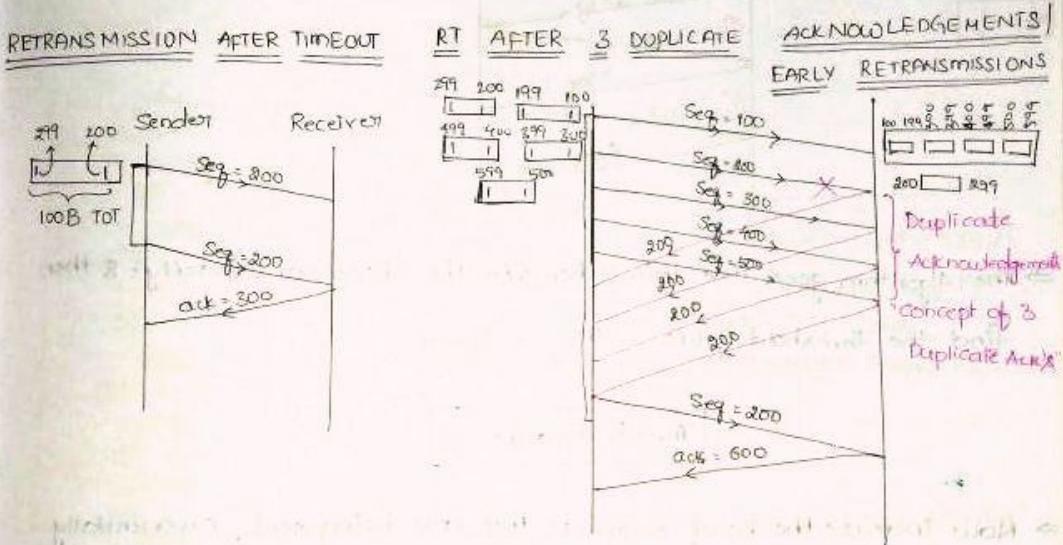

calculate checksum only on the fields in pseudo IP header
Because other fields will change when the packet is received by receiver

14. OPTIONS IN TCP HEADER

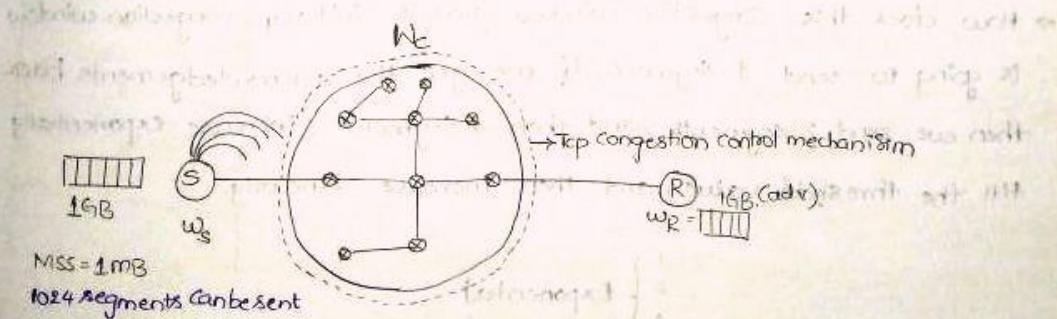

- ⇒ Time Stamp (WAT < LT)
- ⇒ Window size Extension
- ⇒ Parameter Negotiation
- ⇒ Padding

15. RETRANSMISSIONS IN TCP

- ⇒ TCP USES SR + GBN
- ⇒ $w_s = w_R \rightarrow$ Acknowledgements are cumulative
- ⇒ out of order packets are possible $\rightarrow 25\% \text{ GBN}$
- 75% SR

16. INTRODUCTION TO TCP CONGESTION CONTROL

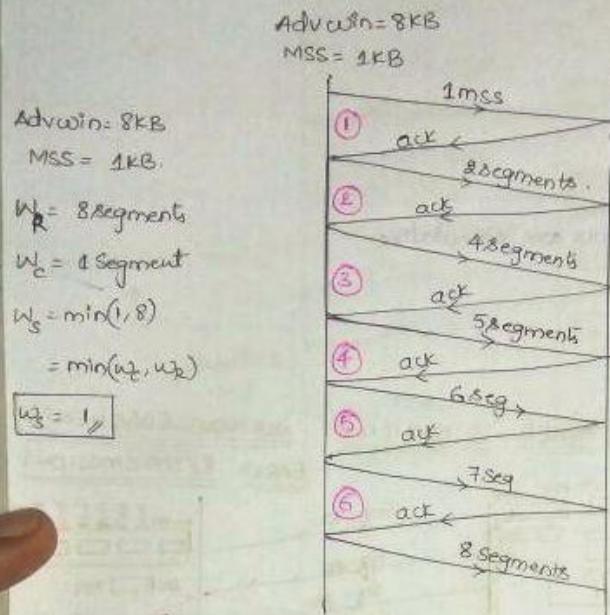

⇒ Assume that the receiver has said that sender can send 1GB of data in the Advertising window. $\rightarrow w_s = 1\text{GB}, w_R = 1\text{GB}$

⇒ The problem here is even though the Receiver can hold 1GB of data the underlying Network cannot hold 1024 packets.

⇒ So the sender should not dump the data ON the Network without finding the capacity of the Network (W_c).

⇒ A sender should always send $\min(W_c, W_R)$ data to the Network & Receive so we should stop the traffic at sender side.

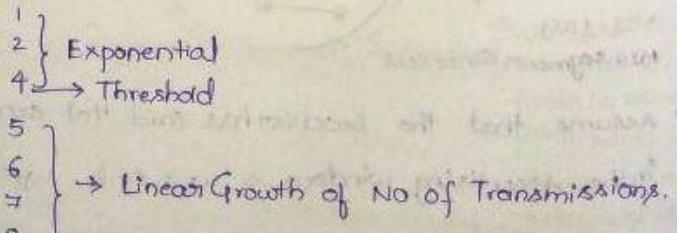

→ Even though you can send 8 segments at a time don't do it because the underlying N/w may not be in a position to handle the segments. So send segments one by one in some order.

⇒ The Algorithm goes like this whenever the Receiver capacity = 8 then find the threshold value = $W_{s/2} = 8/2 = 4$

Threshold value = 4

⇒ Now increase the no. of segments that are being sent, exponentially upto the threshold value and after that send the packets Linearly.

⇒ How does this congestion window grow? Initially congestion window is going to send 1 segment, if we get the acknowledgements back then we send 2 segments, and then 4 segments (increase exponentially till the threshold value) and then increase Linearly.

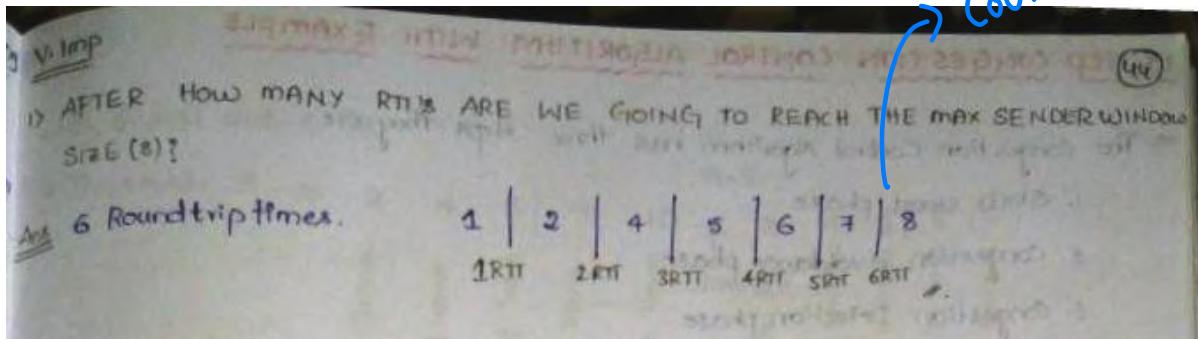

[Medium] Que: 2 Compute the fraction of the bandwidth that is wasted on overhead (headers and retransmissions) for protocol on a heavily loaded 50-kbps satellite channel with data frames consisting of 40 bits header and 3960 data bits. Assume that the signal propagation time from the earth to the satellite is 270 msec. ACK frames never occur. NAK frames are 40 bits. The error rate for data frames is 1%, and the error rate for NAK frames is negligible.

a. 1.21%
b. 2.12%
c. 1.99%
d. 1.71%

100 frames

 \end{aligned}$$

Count No. of Lines

17 Adv Win = 16KB

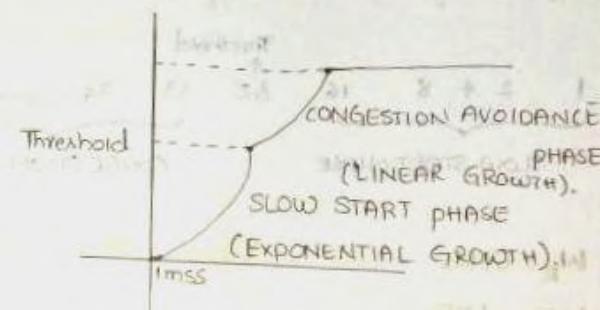

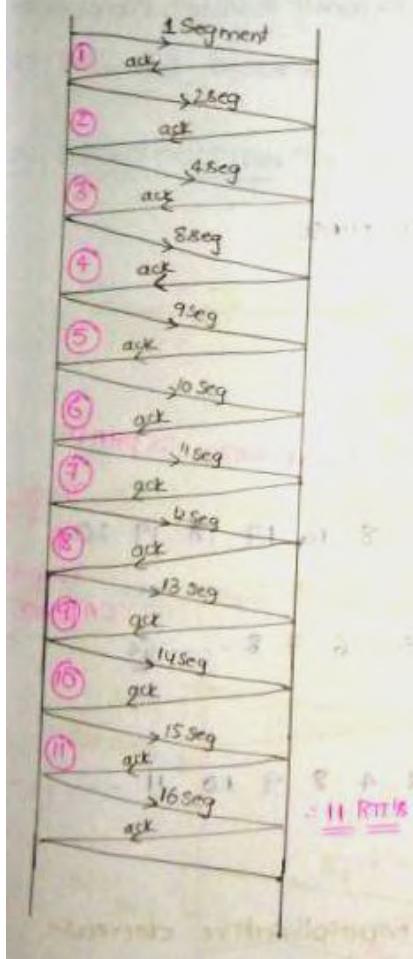

MSS = 1KB

$W_R = 16 \text{ Segments} \rightarrow \text{Threshold} = 16 \times \frac{1}{2} = 8$

$W_c = 1 \text{ Segment}$

1	2	4	8	9	10	11	12	13	14	15	16
1RTT	2RTT	3RTT	4RTT	5RTT	6RTT	7RTT	8RTT	9RTT	10RTT	11RTT	

⇒ 11 RTT's

SS PHASE = "EXPONENTIAL GROWTH".

CA PHASE = "LINEAR GROWTH".

13. Ans: (c)

Sol: In slow start phase of TCP congestion control algorithm.

- The CWND increases by 1 MSS on every successful ACK.
- The CWND approximately doubles every RTT.

Q.1 Which of the following statements are true about increase/decrease policies for fairness and efficiency in congestion control?

- Additive increase reduces fairness.
- Additive increase improves efficiency.
- Multiplicative increase improves fairness.
- Multiplicative decrease improves fairness.

Other way of thinking about AIMD

When we increase the window size in the Additive increase phase it will increase the efficiency of the host by sending more segments in the round trip time.

In multiplicative decrease algorithm gives us fairness because there must be some bottleneck link in the network that need to be the size of the window. So it is fair to decrease the window size.

For AIMD, every additive increase multiplicative decrease cycle improves fairness just a little bit more, while every additive increase takes the network closer to the efficiency line.

17. TCP CONGESTION CONTROL ALGORITHM WITH EXAMPLE

⇒ The congestion control algorithm has three steps they are

1. Slow start phase
2. Congestion avoidance phase
3. Congestion Detection phase

⇒ There are 3 ways to detect congestion they are

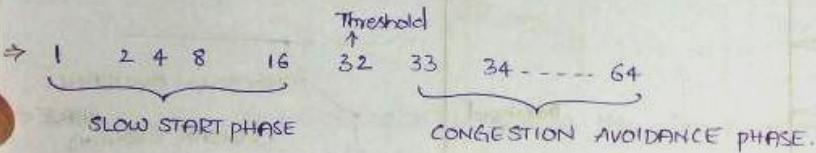

Strong possibility of congestion ✓ 1. Time out (Severe Congestion) ⇔ (SS PHASE)

Weak possibility of congestion ✓ 2. Three Duplicate Acknowledgements (Mild congestion) = (CA PHASE)
✗ 3. ICMP Messaging (source Quench). (Most of the implementations don't consider it)

1) $W_R = 64 \text{ KB}$

$\text{MSS} = 1 \text{ KB}$

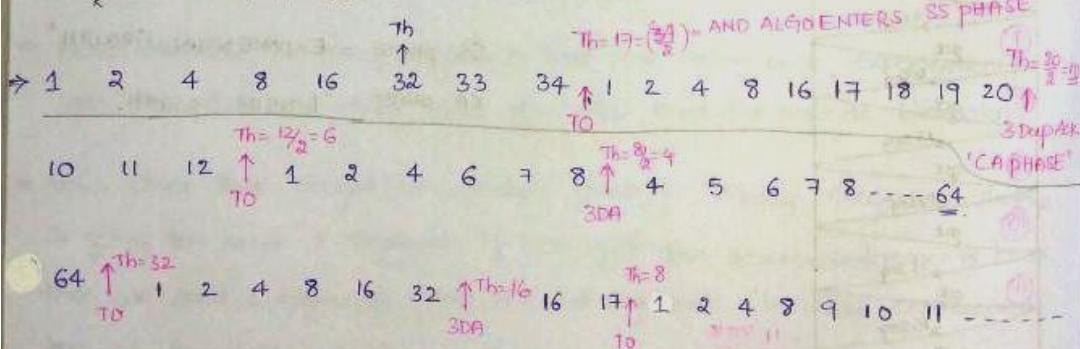

$W_R = 64 \text{ Segments} \Rightarrow Th = 64 / 2 = 32 \text{ MSS}$

2) $W_R = 64 \text{ KB}$

$\text{MSS} = 1 \text{ KB}$

$W_R = 64 \text{ MSS} \Rightarrow Th = 32 \text{ mss}$

GATE

Consider an instance of TCP Additive Increase Multiplicative decrease (AIMD) algorithm where the window size at the start of ssphase is '2' MSS and the threshold at the start of 1st transmission is '8' mss. Assume timeout occurs during 5th transmission, find the congestion window size at the end of 10th transmission?

- (A) 8 mss (B) 14 mss (C) 7 mss (D) 12 mss

Q.2 Assume the scenario of AIMD where the size of the congestion window of a TCP connection is 4KB when timeout occurs, the initial threshold is 3KB. At which transmission from the start sender window reaches to 20 KB after timeout?

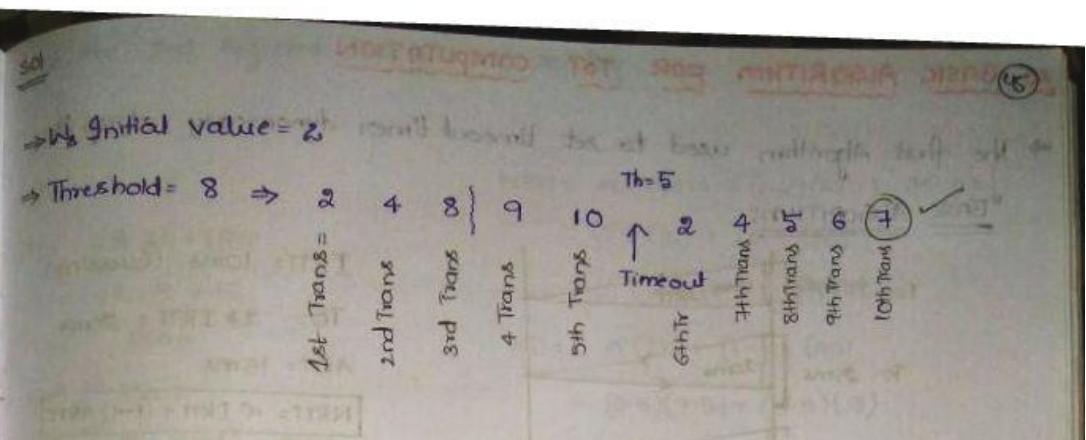

Solutions:

- 10
- 11

Solutions (10):

- First transmission: 2 KB
- Second transmission: 4 KB
- Third transmission: 8 KB
- Fourth transmission: 16 KB
- Fifth transmission: 32 KB
- Sixth transmission: 48 KB (Threshold reached)
- Seventh transmission: 48 KB (Timeout occurred, new Th = 20KB)
- Eighth transmission: 2 KB
- Ninth transmission: 4 KB
- Tenth transmission: 8 KB
- Eleventh transmission: 16 KB
- Twelfth transmission: 20 KB

At the 11th transmission the window size reaches to 20 KB

18. TCP TIMER MANAGEMENT

To Handle Late packets

1) Time-wait timer \Rightarrow Don't close the connection immediately wait for $2 * LT$

Keep alive timer is used to prevent a long idle connection between the 2 TCP's

2) Keep-Alive timer \Rightarrow close All the idle connections

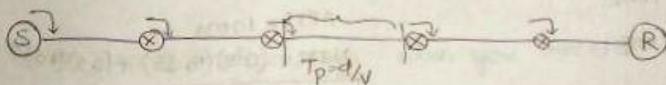

It keeps window size information flowing even if the other end closes its receiver window.

3) Persistent timer \Rightarrow For finding the capacity of Receiver

4) Acknowledgement timer \Rightarrow cumulative Acknowledgement for Piggy Backing

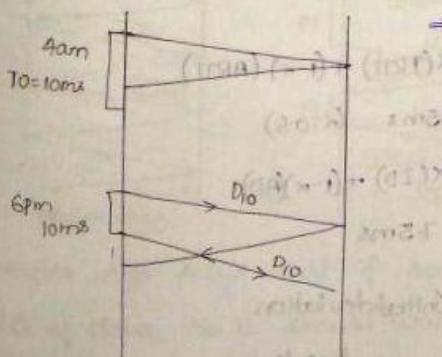

5) Time-out timer \Rightarrow

19. INTRODUCTION TO TIME-OUT TIMER

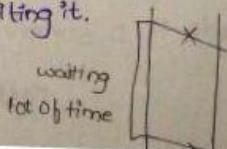

$$\left\{ \begin{array}{l} RTT = 2 * T_p \\ TO = 2 * RTT \end{array} \right.$$

\Rightarrow At TCP static time out timers cannot be used for retransmission

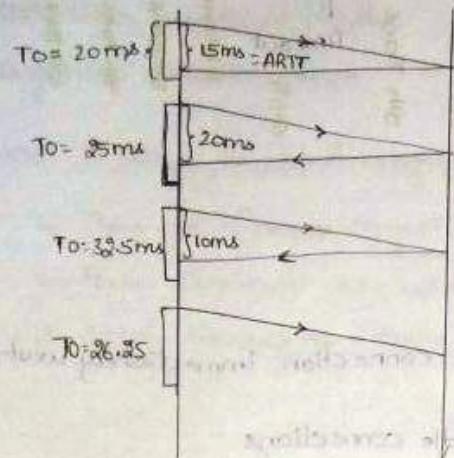

\Rightarrow Initially there is no congestion but after that because of your timeout timer settings it might lead to congestion so have a large timeout timer, but the disadvantage of having large TO is if a packet is lost you have to wait for a long time before retransmitting it.

20. BASIC ALGORITHM FOR TOT COMPUTATION

⇒ The first Algorithm used to set timeout timer dynamically at TCP is

"BASIC ALGORITHM"

$$IRT = 10ms \text{ (Guessing)}$$

$$TO = 2 * IRT = 20ms$$

$$ART = 15ms$$

$$NRT = \alpha IRT + (1-\alpha)ART$$

α = Smoothing Factor

$$0 < \alpha \leq 1 \quad \alpha = 0.5$$

TIME MANAGEMENT

$$NRT = 0.5 \times 10 + 0.5 \times 15$$

$$NRT = 12.5ms \Rightarrow TO = 25ms$$

⇒ This Algorithm is Dynamic Nature

⇒ The disadvantage is $TO = 2 * RTT$

No logic why we are using "2"

IRTT = INITIAL ROUNDTRIP TIME

ARTT = ACTUAL ROUNDTRIP TIME

NRTT = NEXT ROUNDTRIP TIME

for Next packet IRTT = 12.5ms

$$TO = 2 * IRTT = 25ms$$

$$ARTT = 20ms$$

$$NRTT = (0.5)(12.5) + (0.5)(20)$$

$$NRTT = 16.25ms$$

for Next packet IRTT = 16.25

$$TO = 32.5ms$$

$$ARTT = 10ms$$

$$NRTT = (0.5)(16.25) + (0.5)(10)$$

$$NRTT = 13.125$$

21. JACOBSON'S ALGORITHM FOR TIMEOUT COMPUTATION AND KARN'S MODIFICATION

⇒ The Jacobson's Algorithm is used to set the timeout timer.

① Initialization on the start of initial

$$IRT = 10ms \quad NRTT = \alpha(IRT) + (1-\alpha)(ARTT)$$

$$ID = 5ms$$

$$AD = 15ms \quad (\alpha = 0.5)$$

$$TO = 4 * ID + NRTT$$

$$= 4 * 5 + 10$$

$$= 30ms \quad \text{interval for retransmission}$$

$$ND = \alpha(ID) + (1-\alpha)(AD)$$

$$= 7.5ms$$

$$ARTT = 20ms$$

$$ID = \text{Initial deviation}$$

$$AD = 10ms (IRT - ARTT)$$

$$ND = \text{deviation}$$

for the 2nd segment that you are sending

$$IRTT = 15 \text{ ms}$$

$$ID = 7.5 \text{ ms}$$

$$TO = 4 * ID + IRTT$$

$$= 4 * 7.5 + 15$$

$$ID = 45 \text{ ms}$$

$$ARTT = 30 \text{ ms}$$

$$AD = (30 \text{ ms} - 15 \text{ ms}) = 15 \text{ ms}$$

$$NRTT = \alpha (IRTT) + (1-\alpha)(ARTT) \quad \{\alpha=0.5\}$$

$$= (0.5)(15) + (0.5)(30)$$

$$= 7.5 + 15 = 22.5 \text{ ms}$$

$$ND = \alpha (ID) + (1-\alpha)(AD)$$

$$= (0.5)(7.5) + (0.5)(15)$$

$$= 11.25 \text{ ms}$$

for the 3rd segment that you are sending

$$IRTT = 22.5 \text{ ms}$$

$$ID = 11.25 \text{ ms}$$

$$TO = 4 * ID + IRTT$$

$$= 4 * 11.25 + 22.5$$

$$= 67.5$$

$$ARTT = 10 \text{ ms}$$

$$AD = 12.5$$

$$NRTT = \alpha (IRTT) + (1-\alpha)(ARTT) \quad \{\alpha=0.5\}$$

$$= (0.5)(22.5) + (0.5)(10)$$

$$= 16.25$$

$$ND = \alpha (ID) + (1-\alpha)(AD)$$

$$= 0.5(11.25) + 0.5(12.5)$$

$$= 11.875$$

$$TO = 4 * D + RST = 63.75$$

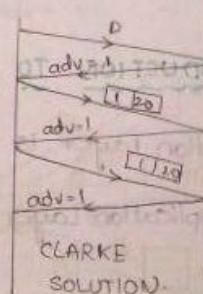

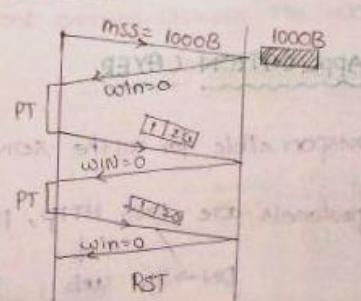

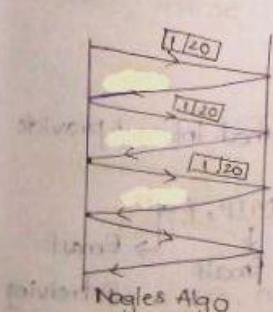

⇒ Karn's modification says when you receive the acknowledgement for the packet after the timeout, keep doubling the TO for the next packets.

Scenario: Receiver has advertised its window size as 1000 and sender has filled the window after some packets.

Also known as probe ACK mechanism

Now, window size is ZERO. So, sender will send 1 bit of data after persistent timer.

2. SILLY WINDOW SYNDROME

Another scenario: when sender is producing very small amount of data

⇒ Nagles Algo says that if sender is very slow the TL should not send 1B of data, the TL should wait for 1RTT and collect the data that has come in 1RTT time and send that data in one segment.

⇒ Clarke Algo says that Receiver should not advertise 1 it should wait until it gets a size of 1mss or half of the Buffer.

Traffic Shaping

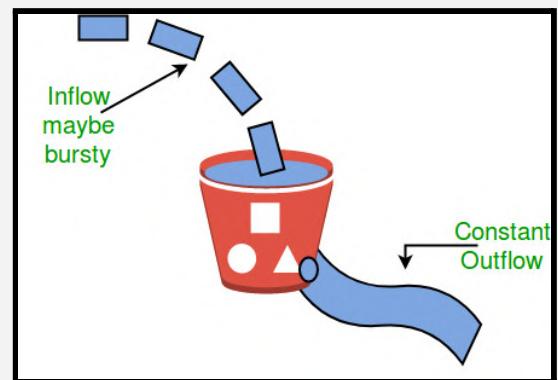

- Another way of Congestion control is to "Shape the Traffic" before it enters the network.
- During Connection establishment, the sender and receiver negotiates a traffic pattern.
- Traffic shaping helps to regulate the rate of data transmission and reduces congestion. There are 2 types of traffic shaping algorithms:
 - Leaky Bucket
 - Token Bucket

Leaky Bucket Algorithm

Let us consider an example to understand: Imagine a bucket with a small hole in the bottom. No matter at what rate water enters the bucket, the outflow is at constant rate. When the bucket is full with water additional water entering spills over the sides and is lost.

Similarly, each network interface contains a leaky bucket and the following steps are involved in leaky bucket algorithm:

- When the host wants to send a packet, the packet is thrown into the bucket.
- The bucket leaks at a constant rate, meaning the network interface transmits packets at a constant rate.
- Bursty traffic is converted to uniform traffic by the leaky bucket.
- In practice the bucket is a finite queue that outputs at a finite rate.

Token bucket Algorithm

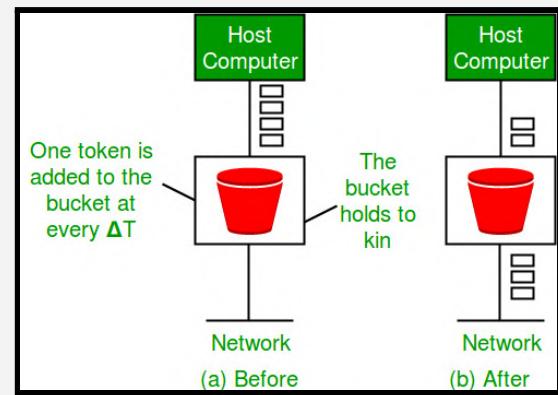

Need of token bucket Algorithm: The leaky bucket algorithm enforces output pattern at the average rate, no matter how bursty the traffic is. So in order to deal with the bursty traffic we need a flexible algorithm so that the data is not lost.

Formula: $M * t = C + p * t$

where t – is time taken, M – Maximum output rate

p – Token arrival rate

C – Capacity of the token bucket in byte

Q. 43

A Computer has to 'ingest' of data into the network. The data is generated and transmitted in bursts of 21 MBps. The minimum sustainable transmission rate across routers in the network is 5 Mbps. If computer transmission is shaped using a leaky bucket, what is the minimum size of the buffer to prevent any data loss? (in MBts) [Up to 1 decimal place]

21.2 MBps
5 Mbps
Leaky bucket regulator

Solution :
21.2 MBps - 21.2
Data generation rate = 6 Mbps and sender want to send 21 MB data therefore time required to send 21 MB data = $\frac{21 \times 10^6}{6 \times 10^6} = 29.36$ sec.
New transmission rate into network = 5 Mbps
Therefore in 29 sec it can transmit $5 \times 29 = 145$ MBps = 146.8 Mbps
Therefore bucket must hold = $168 - 146.8 = 21.2$ MBts data to prevent data loss.

Your Answer is 28

The process with the connected UDP socket can call connect() again for the socket for one of the two reasons :
* to specify a new IP address and port
* to disconnect the socket

UDP is used for IP Tunnelling & Remote procedure call(RPC)

13. UDP

1. NEED FOR UDP

⇒ TCP is going to be disadvantageous for some applications they are

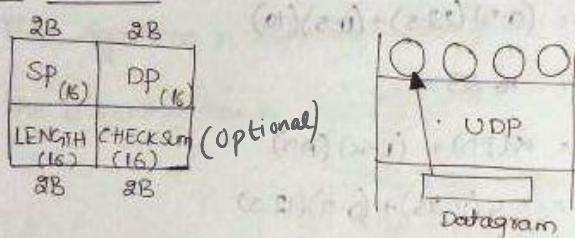

1> If Application needs 1 Request and 1 Reply Ex: DNS, BOOTP, DHCP, NTP
(Network Time protocol),

NNP (Network News protocol), "out of
day" protocol,
TFTP, RIP, OSPF

2> Broadcast or Multicast

3> Fastness rather than Reliability (Multimedia Applications) (online game)

UDP HEADER

⇒ Checksum is calculated on
UDP Header + UDP Data +
pseudo Header from IP.

⇒ UDP should communicate the options to the IP Datagram, the various options are 1> Trace route 2> Record Route 3> Time Stamp

⇒ Additional Responsibilities of UDP is, if we get any ICMP error packets
UDP should inform Application Layer

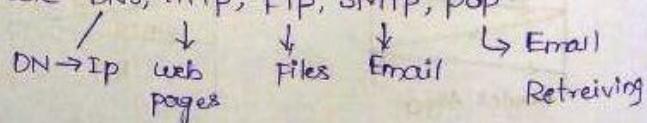

[UDP neither handles congestion control nor flow control.]

14. APPLICATION PROTOCOLS

1. INTRODUCTION TO APPLICATION LAYER

⇒ Application Layer is responsible for all the services that internet provide

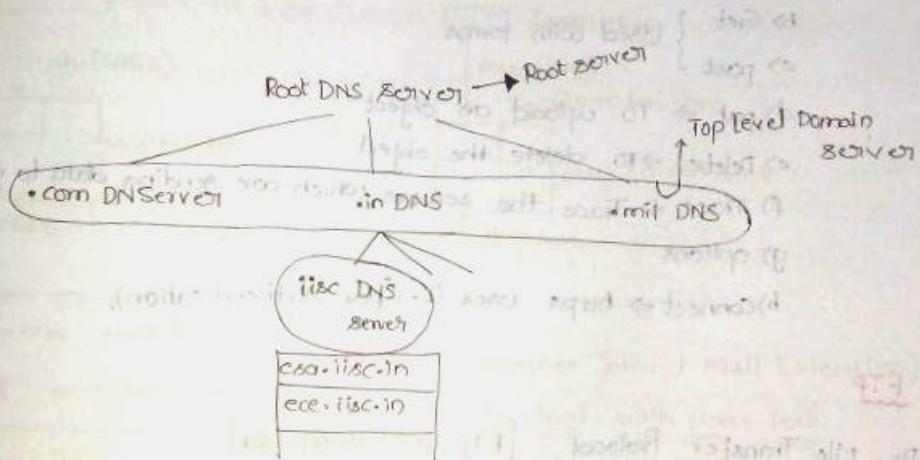

⇒ The Application Layer protocols are DNS, HTTP, FTP, SMTP, POP

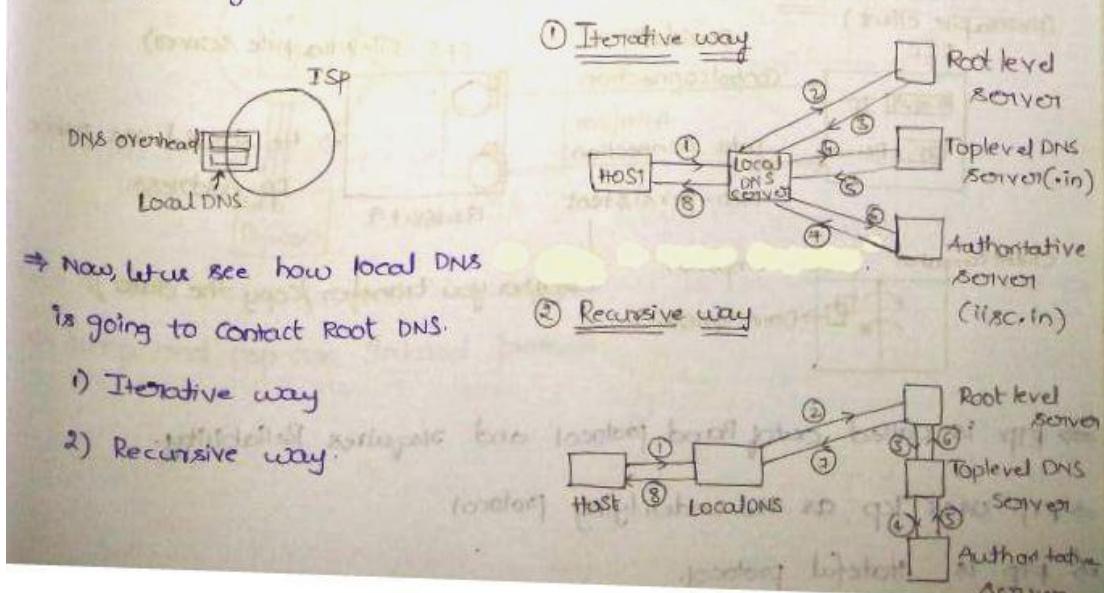

DNS actually uses UDP and both TCP

DNS PORT NO: 53

- ⇒ DNS = DOMAIN NAME SERVICE (DNS Uses UDP at Transport Layer)
- ⇒ To convert Domain name to IP Address we use DNS.
- ⇒ The various domains are
 - Generic Domains (.com, .edu, .mil, .org, .net)
 - Country Domains (.in, .us, .uk...)
 - Inverse Domain (Given IP Address → find Domain Name)
- ⇒ To find the IP Address of a website type "NSlookup www.google.com"
- ⇒ DNS is also used for Load Balancing
- ⇒ DNS Database is organized in this way (Distributed Database)

⇒ what if the Root DNS Server fails, so IETF (INTERNET ENGINES TASK FORCE) manage 13 Root servers across the world.

Story of xxx domain, 2010

Tanenbaum - CN

Solution: 40
Note: Marks is assigned to all here as no question is being asked here.

For non persistent HTTP with no parallel connection:
2 RTT = one for TCP connection + one for base file.
20 objects = Each object requires 2 RTT = 40 RTT
 $X = 2 + 20 = 42 \text{ RTT}$

Correct Answer

3. HTTP

HTTP → PORT NO = 80

- ⇒ Hyper text trans for protocol (For getting web pages).
- ⇒ Http always need Reliability.
- ⇒ Http uses "Tcp" at Transport layer.
- ⇒ Http is Inband protocol (Both data and commands go in one connection).
- ⇒ Http is stateless protocol.
- ⇒ The two popular versions of Http are : Http 1.0 (Non-persistent connection) and Http 1.1 (Persistent connection).
- ⇒ The popular methods that are used by Http are
 - a) Head ⇒ Get the Header of webpage (metadata).
 - b) Get } Used with forms
 - c) post
 - d) put ⇒ To upload an object
 - e) Delete ⇒ To delete the object
 - f) Trace ⇒ Trace the servers which are sending data to you.
 - g) options
 - b) connect ⇒ https uses it. (For Authentication).

4. FTP

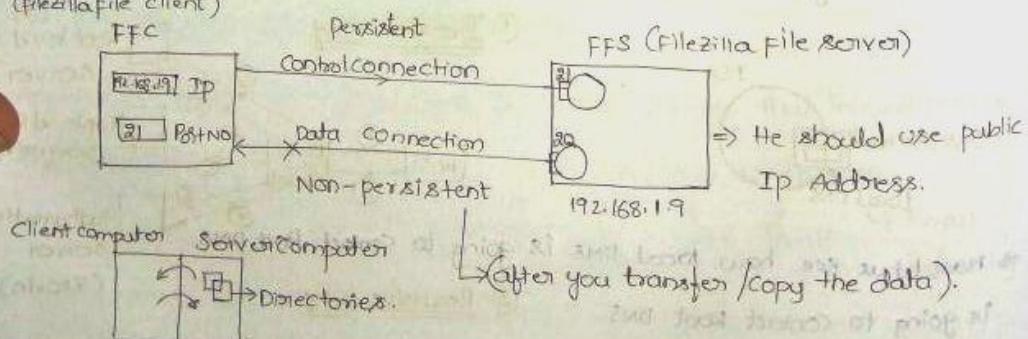

FTP = File Transfer Protocol.

FTP PORT Num = 21

- ⇒ Tectia, filezilla are the two most popular FTP's.

- ⇒ FTP is used to transfer files.

(filezilla file client)

- ⇒ FTP is called out-of-band protocol and requires Reliability.

- ⇒ FTP uses Tcp as the underlying protocol.

- ⇒ FTP is stateful protocol.

Statefull protocols

5 SMTP AND POP

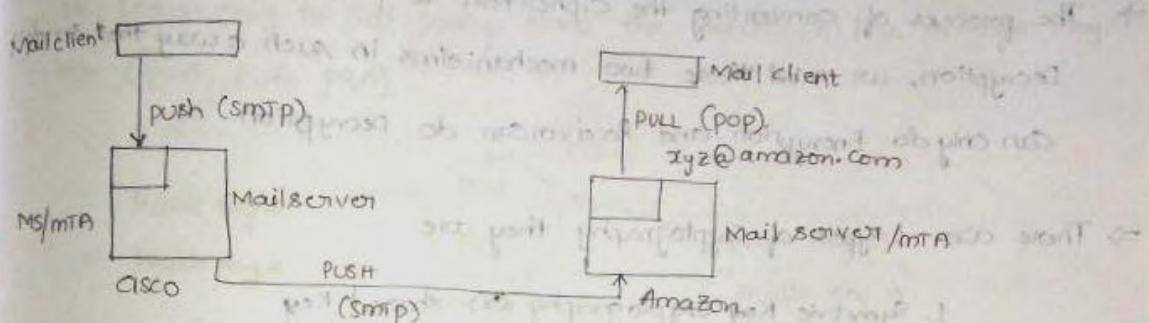

SMTP - Simple Mail Transfer Protocol, POP = post office protocol.

⇒ E-mails are transferred using SMTP

⇒ we cannot transfer the files using FTP because to transfer the files using FTP both server and client should be online.

⇒ Gmail is the web based mail

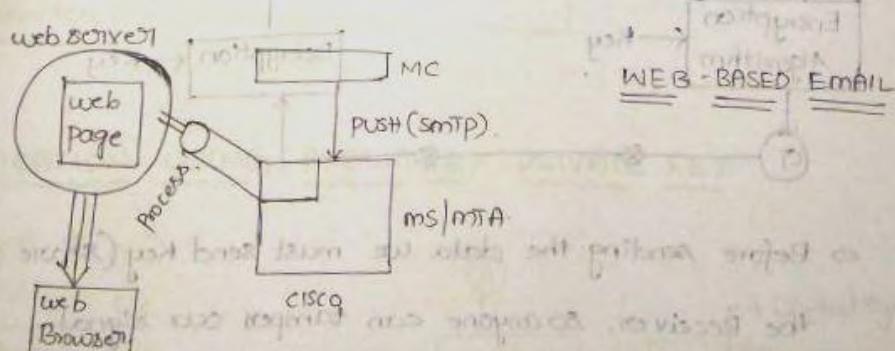

⇒ MTA = Mail Transfer Agent

Non-Text → Text
 Text → Non-Text

→ MIME (Multipurpose Internet Mail Extension) protocol To deal with Non-Text.

What Gmail does ?

⇒ SMTP and POP are Inband protocols.
